Message

It is my great pleasure to note that the report on Violence Against Women Survey 2011 prepared by Bangladesh Bureau of Statistics is being published. Violence against women is a major concern all over the world and Bangladesh is not above the social stigma of this common phenomenon.

The society is aware that violence can result in physical, mental, sexual, reproductive health and other health problems. Yet, lack of proper education, exposure to child maltreatment or witnessing violence in the family, harmful use of alcohol, attitudes accepting violence and gender inequality are some common factors those influence a perpetrator in commencing violence. The Government of Bangladesh is highly committed to eliminate all forms of violence against women and has prioritized establishing legal framework and institutional arrangements to support victims. We like to see the country free of gender violence and inequality and the government is working hard to bring the women in the mainstream of development as half of our population are female. I do believe that violence could be reduced by changing attitudes.

I am also very pleased that Bangladesh Bureau of Statistics under the active guidance of Statistics and Informatics Division (SID), for the first time has successfully conducted a full-fledged survey. I am confident that the policy makers, planners, researchers, development partners, related activists and other stakeholders will find this report very useful. This report will also help the government in fulfilling the rights of women and building a happy society along with the socio-economic development of the country.

I like to take this opportunity to extend my heartfelt thanks to the Secretary, Statistics and Informatics Division (SID), the Director General, Bangladesh Bureau of Statistics (BBS) and all other officials of SID and BBS for their relentless efforts in conducting the survey and bringing out this report.

I wish the report on Violence Against Women Survey 2011 a great success.

Dhaka, December 2013

Air Vice Marshal (Retd.) A K Khandker, BU

Secretary
Statistics and Informatics Division (SID)
Ministry of Planning
Government of the People's Republic of Bangladesh

Foreword

Violence against Women (VAW) is a common phenomenon prevailing throughout the world. In Bangladesh, the Government and other stakeholders have been observing its trend and trying to address it appropriately. Generally there is a perception that home is the safe heaven for women to live. But in reality women are also in risk of experiencing violence by intimate relationships at home than anywhere else. Violence against Women by husband, dear and near ones are major concerns of the society. Violence against Women has become endemic and has a deeper impact than the immediate harm caused by it. It has devastating consequences on the women who experience it and traumatic effect on those who witness it, particularly the children. Violence against Women is a violation against human rights. It needs to be controlled by all means through legal and social movement.

Incidentally, adequate statistics on prevalence of violence, identification of perpetrators along with their motives, impact of violence on health and social status and mental position of the victims are not available. Without adequate statistics it is not possible to take appropriate protective measures against violence.

As a National Statistical Organization, Bangladesh Bureau of Statistics (BBS) has undertaken a comprehensive survey to develop the benchmark indicators on different aspects of prevalence of Violence against Women, identification of perpetrators, circumstances behind occurrence of these events and determination of the impact of violence on the victims.

I thank UNFPA for providing financial and technical support to BBS for conducting the survey. I also thank the Working Group comprising of experts from Government of Bangladesh, Research Organizations, International Organizations and NGOs for their technical backstopping in conducting the survey and finalization of the report.

I congratulate the Director General of BBS and his team, distinguished members of the Technical Committee for completing the survey successfully and also bringing out this report in time.

I hope that the report will be useful to the planners and policy makers in addressing the root causes of Violence against Women in Bangladesh.

Dhaka, December, 2013

(Md. Nojibur Rahman)

Director General
Bangladesh Bureau of Statistics (BBS)
Statistics and Informatics Division (SID)
Ministry of Planning
Government of the People's Republic of Bangladesh

Preface

Bangladesh Bureau of Statistics has conducted a comprehensive survey on Violence Against Women for the first time in 2011. UNFPA provided financial and technical support for the survey. The main objective of the study was to generate official statistics on the status of Violence Against Women in Bangladesh. To ensure representation of each division with urban rural break-up the survey was done in a subset of existing Integrated Multi Purpose Sample (IMPS) of BBS with allocation of clusters from 7 urban and 7 rural substrata representing 7 administrative Divisions of the country. The survey covered 420 PSUs from IMPS design and 12600 households. From each household one woman was selected as respondent for the survey. It may be mention that, during designing the questionnaire, experts from research organizations and NGOs were consulted and the recommendations of United Nations Statistics Division were reviewed. The questionnaire was designed in ICR readable format. It has 4 modules namely (1) Household module, (2) Individual module, (3) Husband module and (4) Non-partner module.

Data were captured from the filled-in questionnaires by out sourcing the job to save time. Data processing, data analysis and report writing were done by the experts of BBS with technical guidance of technical committee.

I am grateful to UNFPA for their technical and financial assistance and representatives of universities, research organizations and NGOs for technical support in designing the survey and conducting the field operation.

I like to express my sincere thanks to Mr. Md. Zahidul Hoque Sardar, Project Director, Mr. Abdullah Harun Pasha, Ex. Project Director, Mr. Tahidul Islam, Deputy Director, Ms Shaleha Khatun, Statistical Officer, Mr. Maksud Hossain, Statistical Officer, and other colleagues of GIS project of BBS for organizing the survey, processing and analyzing the data and bringing out this report. The members of the working group deserves special thanks for their input in the analytical improvement of the report.

I hope the report will be useful to the planners, administrators, researchers, policy makers and development partners to combat the challenges of violence against women. Any constructive suggestions for further improvement of the report will be appreciated.

Dhaka, December, 2013

(Golam Mostafa Kamal)

UNFPA Representative
UNFPA Bangladesh

Message

Violence against Women (VAW) is a global phenomenon, to the deep dismay of the citizens in both developed and developing countries. Bangladesh has the eighth largest population in the world, with an estimated 75 million female citizens. The past decade has been a period of incredible growth for Bangladesh, with vast improvement on many social and economic indicators of development. Unfortunately, sex and gender based violence continues to be an area of serious national concern. According to the 2011 Bangladesh Demographic and Health Survey, 87% of Bangladeshi women and girls experience sex and gender-based violence at least once in their lifetime.

The study “Ending Violence against Women: From Words to Action” launched at the General Assembly in October 2006, provides a comprehensive examination of the universality and scope of VAW and its inter-related challenges and lacunae in public responses. As a follow-up of the study, the General Assembly adopted a comprehensive resolution (A/RES/61/143) which called upon Member States and the UN system to intensify their efforts to eliminate VAW. Bangladesh through this survey, conducted by the Bangladesh Bureau of Statistics, has become one of the pioneers who has conformed with the decision of the UN resolution to establish a national system for data collection and analysis on a set of VAW outcome indicators and other methodological standards by 2015.

Gender-based violence is both the cause and effect of all the problems. Discrimination, inequality, oppression, re-productive health issues, and violence are all mutually reinforcing. I am glad to know that the survey identified the levels and magnitudes of the violence against women by their husband, ex-husband, intimate partner and non-partner perpetrators. The study reveals the existence of enormous physical, sexual, psychological and economic violence that Bangladeshi women and girls endure every day. I hope the survey results will fill the vacuum of the nationally representative quantitative data on gender based violence.

UNFPA in partnership with the Government is striving for a Bangladesh where women and girls can live without fear. I hope the data and information generated through this survey will bring immense benefit to the policy makers and civil society actors in their policy planning and programming for a society free from all sorts of discrimination and inequalities.

Acknowledgements

I feel delighted to acknowledge the contributors who played important role in conducting the survey and preparation of the report on Violence Against Women (VAW) 2011, the first of its kind in Bangladesh as a full-fledged survey following the UN guidelines. It is worth mentioning that the staff members of BBS have professionally and successfully carried out this survey by overcoming the challenges of data collection from the female respondents on this sensitive issue.

I would like to express my humble gratitude and thanks to Mr. Md. Nojibur Rahman, Secretary, Statistics and Informatics Division and Mr. Golam Mostafa Kamal, Director General, Bangladesh Bureau of Statistics for their valuable suggestions, patient guidance and all out support starting from the survey design and completion of the report. Mr. Md. Mizanur Rahman, Deputy Director General of BBS also deserves special thanks for his overall supervision and support.

It is my immense pleasure to mention that UNFPA Bangladesh has provided support in undertaking the survey and preparation of the report. I wish to thank UNFPA for their partnership in statistical business of BBS.

I am particularly grateful to the BBS officials namely Mr. Md. Shamsul Alam, Director, Dr. Dipankar Roy, Deputy Director, Mr. Mohammad Shaheen, Deputy Director, Mr. Md. Tahidul Islam, Deputy Director, Ms. Shaleha Khatun, Deputy Director, Mr. Md. Maksud Hossain, Statistical Officer who were the active members of the Core Survey Team.

My great appreciation is due to the members of the project management team of Strengthening Capacity of BBS in Population and Demographic Data Collection using GIS Project for their relentless efforts in this exercise.

I am deeply indebted to the contributions of various stakeholders and agencies concerned who always provided their valuable suggestions and comments towards the successful completion of the survey and report. My heartfelt thanks are also due to the respondents and communities for their cooperation in data collection from field.

Hope the users and readers will continue their suggestions and comments for further improvement.

Dhaka, December, 2013

Md. Zahidul Hoque Sardar

Definitions of Note and Concept:

Household: One or more members who usually live together and eat from the same kitchen using same utensils form a household.

Domestic helper: Considered as member of the household if he/she was living in the household for at least 6 months or more.

Eligible women: Women aged 15 years and above who live in the sample household.

Guest: Guest considered member of the household if he/she was living in the household for 6 months or more.

Partner: Her husband (current & previous).

Non-partner: Anybody other than husband.

Perpetrator: A criminal or offender.

Jaa: Wife of husband's Brother.

Nanad: Husband's Sister (Younger than him)

Current husband: Married in current time & having husband

Previous husband: Married previously without having that husband at present including widowed/divorced or married currently again

For this survey, VAW was classified into four major categories: (1) Psychological, (2) Physical, (3) Sexual and (4) Economic. When a respondent expressed that she had experienced at least one of the following acts by a current or previous husband or non-partner, it was considered an act of violence against women:

1) Psychological violence (i.e. husband exhibits controlling behaviors to wife):

a) Controlling behaviors

- He tries to keep her from seeing her friends?
- He tries to restrict contact with her (parental) family of birth?
- He insists on knowing where she is at all times?
- He ignores her & treats her indifferently?
- He gets angry if she speaks with another man?
- He is often suspicious that she is unfaithful?
- He expects you to ask his permission before seeking health care for her?
- He forces her to maintain Parda/ hijab?
- He obstructs her in studying or doing work?
- He forbids her in going out for recreation?
- Does he utter attacking words against her parents?
- Does he force her to use family planning or forbid family planning?
- Does he misbehave due to birth of a girl?
- Does he misbehave with her due to complaints from her mother-in-law/sister-in-law?
- Does he become angry if she talks on face openly?

b) Abuse against women by husband:

- Insulted or made her feel bad about herself?
- Belittled or humiliated her in front of other people
- Done things to scare or intimidate her on purpose (e.g. shout loudly & smash things)?
- Verbally threatened to hurt her or someone she cares about?

- Threaten to marry other women?
- Threaten to divorce?
- Torture for her relation with neighbors or other women?

2) Physical violence:

a) Physical violence by Partner (husband)

- Husband slapped, fist, boxed or threw something and she got hurt
- Pushed her or shoved her or pulled her hair by force.
- Shake with hot things.
- Threw acid or hot water
- Intentionally suffocated her
- Choked or burnt her on purpose
- Threatened with gun, knife or other sharp weapons
- Struck her with stick or heavy things

b) Physical violence by non-partners:

She was hit, beaten, kicked or done anything else to hurt her physically-or mistreated in any way by anyone other than husband; a) Thrown something at her b) Pushed or pulled hair c) Choked or burnt her on purpose d) Threatened or actually used a gun, knife or weapon against her e) Threw acid f) Threw hot water g) Intimate physical touch without consent with ill motive

3) Sexual Violence:

a) Sexual Violence by husband

- Did husband hurt her or force her to have sexual intercourse when she did not want to?
- Did she ever have sexual intercourse with her husband against her will because she was afraid of what her husband does?
- Did her husband ever force her to do something else sexual that she did not want or that she found degrading or humiliating for her?
- Other sexual torture

b) Sexual violence against women by non-partners includes:

She was forced to have sex or proposed to have sex when she did not want to or to perform a sexual act which she found humiliating or degrading, by anyone (other than husband).

Childhood abuse includes:

She was victim of any physical or psychological violence or sexual harassment or stalking by anyone in childhood: Physical violence, mental violence, sexual harassment/teasing or stalking

4) Economic violence:

- He refuses to give her enough money for household expenses, even when he has money for other things?
- He regularly refuses to pay pocket money?
- Is the marriage happened with money or property as dowry?
- Does he pressurize her to get money or things from her parents' house?

Executive Summary

Background and Context

Violence against Women (VAW) is a global phenomenon, to the deep dismay of the citizens in both developed and developing countries. Many women suffer not only from physical, psychological and sexual violence, causing many physical and mental health problems, but oftentimes become victims of economic violence as well in losing rights and access to financial and other resources.

The United Nations (UN) General Assembly called upon the UN Statistical Division (UNSD) to request the UN member countries to establish systems for data collection and analysis for a set of national VAW outcome indicators and other methodological standards by 2015. In this regard and through this survey, Bangladesh has become one of the pioneers through the rigorous efforts of the Bangladesh Bureau of Statistics (BBS)¹ and its Statistics and Informatics Division.

This survey was designed by the BBS with sampling assistance from Professor Syed Shahadat Hossain, the Institute for Statistical Research and Training (ISRT) at Dhaka University, particularly on sampling methods. In addition, financial and technical support for this survey was provided by the United Nations Population Fund (UNFPA), which had previously provided technical assistance to the BBS to strengthen its capacity in data collection and analysis through the “Strengthening Capacity of BBS in data collection and analysis using GIS Maps” project.

Goal and objectives

The main objective of this survey is to generate official national statistics on the prevalence of violence against women and to observe the overall situation including the forms of violence along with their magnitude in Bangladesh. Another objective is to identify and understand the magnitude and intensity of violence against women, which can help in policy formulation, programs and interventions and also improve the existing laws and act related with this issue.

Survey design and sampling of households

The survey used a stratified two-stage cluster sampling design with 7 urban and 7 rural (second level) strata in each of the 7 administrative divisions (first level independent strata) of Bangladesh. In the first stage, 30 Primary Sampling Units (PSUs with about 250 households each) were selected systematically from each of the 14 strata. At the second stage, 30 single dwelling² HHs was randomly selected from each selected enumeration area (EA). The final sample comprised of 420 PSUs³ and 12,600 eligible women over 15 years of age interviewed about current husband, previous husband or non-partner violence. Data collection was carried out from 19th to 28th December 2011.

Selection of eligible women

One woman member of a selected HH aged 15 years and above became eligible once selected at random by lottery basis. During the interview, eligible women were selected by the enumerator and the supervisor by completing the ‘woman selection form’. A household may or may not have had an eligible woman.

¹ National statistical office (NSO) of Bangladesh responsible for collection, processing, analysis, dissemination and development of databases for the official statistics of the country

² Female students residing in institutional households e.g. halls, hostels etc. were excluded from enumeration

³ Sub-sample of the 1000 Integrated Multi-Purpose Sample (IMPS) PSUs from BBS’ SVRS, which has a regularly updated house listings.

Questionnaire development and pre-testing

To maintain international comparability, the standard questionnaire recommended by the UN Statistics Division (UNSD) was customized to the country context using the prescribed customization process where all relevant government organizations, UN agencies, civil society and INGO/NGOs working in this area were consulted. The survey tools consisted of two questionnaires, namely the household questionnaire which was comprised of the household and individual modules; and the women's questionnaire which was comprised of the current husband, previous husband and non-partner modules.

The survey team and data collection

Female registrars from the BBS's Sample Vital Registration System (SVRS) were engaged as enumerators as they are well trained on data collection and have rapport with the local population. In the majority of cases, the Upazila Statistical Officers (USOs) and Junior Statistical Assistants (JSAs) were engaged as supervisor in SVRS and also engaged as supervisors in this survey. Considering the sensitivity of the survey one supervisor was engaged with one enumerator for consistent and constant supervision and quality control.

Data processing and data analysis

Questionnaires were edited manually and then outsourced for data capturing using ICR technology. Despite manual editing, substantial misread information was found in the scanned results which were further checked and corrected through frequency runs and screen editing. A relational database was prepared using Microsoft Access and tabulations prepared using FoxPro and SPSS software. Tabulation plans recommended by UNSD and also used in different national and international reports were reviewed and incorporated in the analytical tabulation layout of VAW survey of Bangladesh. The layout of the frequency tables and analytical tables were verified by the technical committee.

Violence against women by partners

As many as 87% of currently married women have ever experienced any type of violence by current husband, and 77% reported any type of violence in the past 12 months. Amongst different types of violence reported, psychological violence was most common, followed by physical violence. Prevalence reported in this survey is higher than previously available data⁴. Almost 90% of those who have ever violated by current husband has the past 12-month experience of violence, which implies the persistent nature of spousal violence. Moreover, the survey results among women ever married more than once indicate that 66% of them experienced violence by current as well as previous husbands while almost all (98%) have ever been violated by either current or previous husbands. Rural-urban difference is not statistically significant, nor is observed clear trend by age groups in the prevalence of spousal violence.

Physical violence by partners

Sixty-five percent of married women experienced physical violence perpetrated by their current husbands in their lifetime. The recent incidence is also high as nearly half of married women reported such violence in the past 12 months. The data also indicates that prevalence of physical

⁴ According to Bangladesh Demographic and Health Survey 2007, the percentage of ever-married women aged 15-49 who have ever experienced physical or sexual violence committed by their husband was 48.7% and 17.8%, respectively.

violence seems to be slightly higher in rural than urban areas. Women aged 20-39 seem to have been most exposed to spousal physical violence in the past 12 months.

About half of women received medical attention due to physical violence. About one third of women did not seek for medical treatment in fear of their husbands or due to husband's disapproval. Stigma attached to domestic violence should also be noted as almost 9% of women cited 'social prestige' as reason for not having sought for medical treatment.

Sexual violence by partners

More than one-third of married women experienced sexual violence perpetrated by their current husbands in their lifetime. The recent incidence is also high as nearly quarter of married women reported such violence in the past 12 months. Age group 20-34 seems to be more vulnerable to spousal sexual violence compared to other age groups. For all types of sexual violence, prevalence in rural areas seems higher than urban.

Sexual coercion as a result of physical force or in fear of consequence is the most common sexual violence perpetrated by current husband. As many as 26% of women were ever forced to have sex with husband while over 10% of women experienced more than twice in the past 12 months, including 4% who experienced more than 6 times. Similarly as many as 30% of women ever had sex with their husbands because they were afraid of what the husbands might do if they refuse.

Psychological violence by partners

Psychological violence against married women is extremely common and persistently practiced by their husbands in Bangladesh, as over 80% have ever experienced it in their life time with 72% in the past 12 months. The prevalence seems slightly higher in rural areas than urban. Insulting is the most commonly reported act as 27% of women ever experienced and over 18% experienced more than twice in the past 12 months. This is followed by humiliation in front of others and verbal threatening, both of which were ever experienced by 16% of the women.

Economic violence by partners

About half of ever married women have ever experienced economic violence while one third experienced in the past 12 months. The prevalence seems slightly higher in rural areas than urban. Older women seem to be less likely to have experienced such violence. About one third of women have paid dowry for the current marriage. Furthermore, almost 30% of the women reported that the current husband refuses to pay pocket money while 17% indicated that their current husband refuses to give enough money for household expenses even when he has money for other things.

Violence against women by non-partners

About one-third of women who have ever violated by non-partner has the past 12-month experience of non-partner violence. This indicates that non-partner violence is not a rare event in Bangladesh. Furthermore, when it comes to the recent incidence of non-partner violence, younger age group (below age 29 years old) seems to be more vulnerable.

Physical violence by non-partners

About 8% of women reported the recent incidence of non-partner physical violence in the past 12 months while almost one quarter of the women reported their life-time experience of such violence. Further analysis of non-partner violence by type of perpetrator indicates that parents, step-parents, and parents-in-law combined represent the most commonly-cited perpetrator of physical violence, followed by other family members, including sisters/brothers-in-law.

Sexual violence by non-partners

About four percent of women have ever experienced sexual violence by non-partner, and one percent of women experienced in the past 12 months. More than 40% of women on average and 50% of urban women indicated that they had first forced sex at age 14 and below. Three quarter of women indicated that they had first forced sex at age 19 and below.

Perception about violence

In the non-partner violence chapter of the survey, only two questions were asked with regard to each type of violence (Physical, Sexual & psychological violence) Say for Physical violence : 1) In your opinion, in which marital situation women become victim of Physical violence? 2) In your opinion, where is the place occurring Physical violence?

Women said that married women are likely to become victim of physical violence while about just over 20% of women pointed out the vulnerability of unmarried, separated and divorced women to physical violence.

In case of sexual violence, unmarried women are perceived as the top victim, cited by 54% of rural women and 62% of urban women. In terms of opinions as regard to where is the place occurring sexual violence, husband's house still marks the top most commonly cited site, but the percentage of women who mentioned about it (54%) is much lower than physical violence case (88%).

Similar trend is observed as the case of Psychological violence, with married women being most cited as likely victim.

Experience of abuse in childhood by non-partners

About four percent of the women responded that they had experienced physical torture during their childhood, while three percent of the women had experienced sexual harassment/teasing. The prevalence is higher among rural than urban women.

Age at first marriage

About fifty-six percent of ever married women respondents were first married before they reach 18, the legal age of marriage in Bangladesh. Even among younger generation such as age groups 20-24 and 25-29, over 10% of those married women were married below age 15 and about 50% of them were married below age 18.

Death or attempted suicide cases

Over one percent of women respondents mentioned that their female members died or attempted suicide as result of violence. No significant difference between rural and urban respondents was observed.

Female family members' experience of sexual harassment / teasing in the past one year

About two percent of women respondents mentioned that their female family members had experienced sexual harassment of teasing in the past one year. Prevalence seemed to be slightly higher in urban than rural areas. Out of those who had experienced, 28% were respondents' daughters, 20% were the respondents themselves, and 19% were their sisters.

Women trafficking

Less than one percent of women respondents mentioned that their female family members had become victim of women trafficking.

This is the first nationally representative survey on violence against women (VAW) that is perpetrated by the current husband, previous husband and non-partner perpetrators. The knowledge obtained by this survey is the strongest evidence of the immense physical, sexual, psychological and economic violence that Bangladeshi women endure every day.

The statistics on gender based violence now speak in clear language of the effects and impact on society, demanding immediate action to eliminate all kinds of violence against women and create a society free from discrimination and inequalities. The survey results emphasize that we all need to do better to protect women and prevent this pervasive human rights violation. New and improved laws and their implementation are crucial to end impunity for violence against women and girls. Action plans for safe houses, free hot line services and free health and legal aid to survivors are also important areas.

Bangladesh has signed many international treaties and conventions, and has enacted different national laws and policies in favor of establishing women's rights. However, Bangladesh's personal laws governing marriage, separation and divorce explicitly discriminate against women. These laws give men greater powers than women in marriage and accessing divorce. To take effect, the law should in particular be known and understood by service providers such as the police, lawyers and judges, social workers, health personnel. In the same line, a comprehensive policy response to the Dowry Prohibition Act should be ensured. It would include implementation of the Act and address the under-lying socio-economic reasons.

The specific recommendations and lessons learned are summarized in the Conclusion and recommendation chapter (Chapter 7) of this report.

Key findings and household characteristics (by percentage):

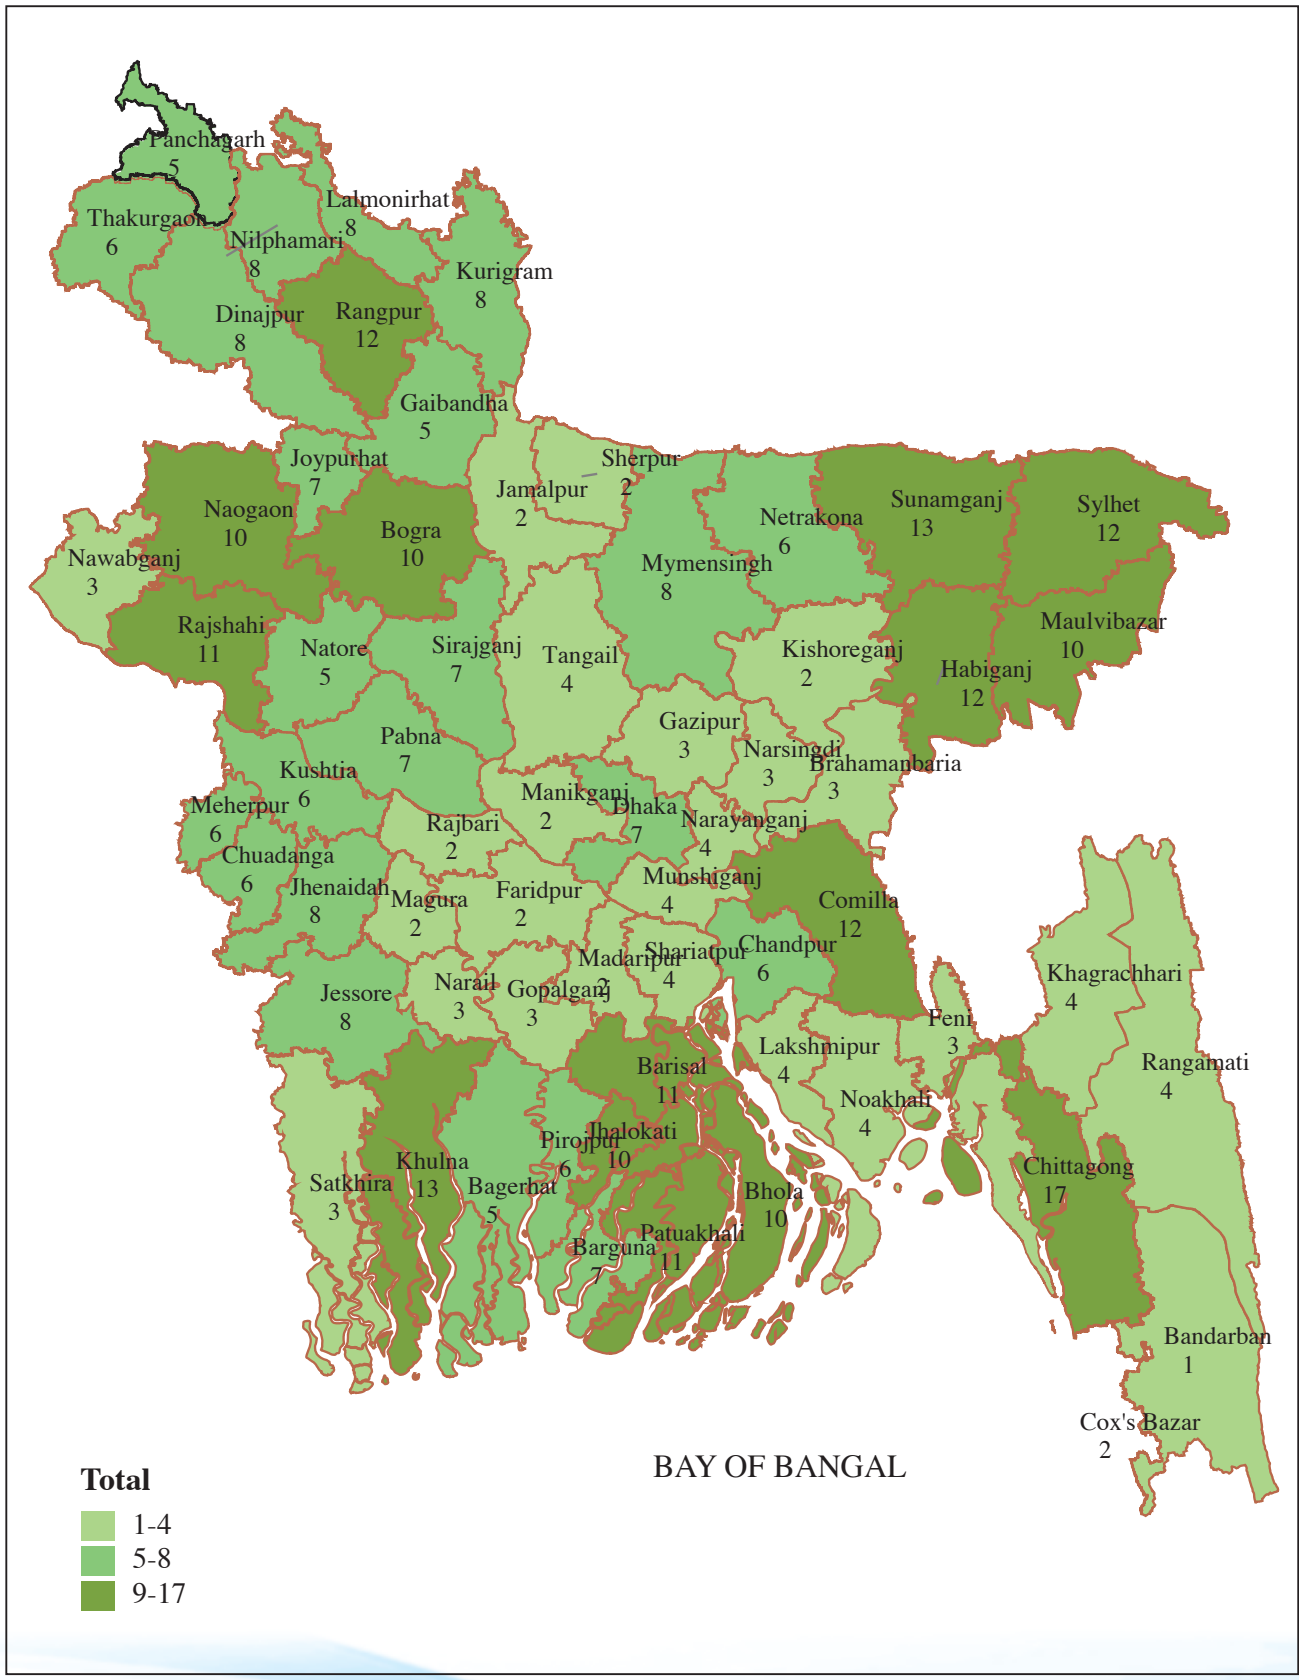

Indicators	Current husband	Previous husband	Non-partner
1. Psychological Violence	81.6	73.2	NA
2. Economic violence	53.2	48.6	NA

Map of Bangladesh showing the sample areas of violence against women survey 2011

Chapter 1

Introduction

1.1 Background

Violence against women (VAW) is a global phenomenon, to the deep dismay of the citizens in both developed & developing countries. Many women suffer not only from physical, psychological and sexual violence, causing many physical and mental health problems, but oftentimes become victims of economic violence as well as in losing rights and access to financial and other resources. In the majority of cases, husbands or intimate partners or other family members are the perpetrators. The effects of this violence affect not only the women themselves, but also their children, family and also society as a whole.

The United Nations General Assembly (UNGA) called upon the UN Statistical Division (UNSD) to request the UN member countries to establish systems for data collection and analysis for a set of national VAW outcome indicators and other methodological standards by 2015. In this regard and through this survey, Bangladesh has become one of the pioneers through the rigorous efforts of the Bangladesh Bureau of Statistics (BBS)¹ and Statistics and Informatics Division of Ministry of Planning.

Although previous studies related to VAW have been conducted in Bangladesh by local non-government organizations, these were not nationally representative. An older study which stands out is the 'WHO Multi-country study on women's health & domestic violence against women' completed in 2005. Bangladesh Demographic and Health Survey 2007 contained violence against women (VAW) module but were not as comprehensive as needed for full reporting (BDHS, 2007). The most recent BDHS does not include a VAW module (BDHS, 2011). Another study was carried out in November 2011 on 'Men's attitude towards violence against women' by the ICDDR,B. These studies served as a sturdy springboard for many of the essential steps taken in this survey.

This survey was designed by the BBS with assistance from Professor Syed Shahadat Hossain ISRT, Dhaka University particularly on sampling methods. In addition, financial and technical support for this survey was provided by the United Nations Population Fund (UNFPA), which had previously provided technical assistance to the BBS to strengthen its capacity in data collection and analysis through the "Strengthening Capacity of BBS in data collection and analysis using GIS Maps" project.

1.2 Goal and objectives

The main objective was to generate official national statistics on the prevalence of violence against women and to observe the overall situation including the forms of violence along with their magnitude in Bangladesh. The strategic information gained from this survey will inform us about prevalence of violence, nature of violence, causes and consequences, risk factors and perception about violence against women. This survey will allow us to have data disaggregated to the national, divisional, urban and rural levels. Furthermore, Bangladesh through the BBS will be in compliance

¹ National statistical office (NSO) of Bangladesh responsible for collection, processing, analysis, dissemination and development of databases for the official statistics of the country

with the United Nations declaration on making data available to measure the violence against women in a number of countries across the world.

Another major objective is to identify and understand the magnitude and intensity of violence against women, which can help in policy formulation, programs and interventions and also improve the existing laws and act related with this issue. This was a comprehensive national survey on violence against women in Bangladesh.

This first nationally representative survey on Violence against Women in Bangladesh was carried out to uncover the context of VAW across the country which will serve to better formulate the appropriate policies, enact the necessary laws and implement effective interventions based on a reliable data source, as well as to create and enhance awareness from the grassroots to the highest levels of government. The results of this study will be used as a baseline source for future research and will be a useful source of planning for comprehensive integrated programs that combat all forms of violence against women in Bangladesh.

Chapter 2

Methodology

2.0 Survey design and sampling of households

The survey used a stratified two-stage cluster sampling design with 7 urban and 7 rural (second level) strata in each of the 7 administrative divisions (first level independent strata) of Bangladesh. In the first stage, 30 Primary Sampling Units (PSUs with about 250 households each) were selected systematically from each of the 14 strata.

At the second stage, 30 single dwelling² households (HH) were randomly selected from each selected enumeration area (EA). With the help of a computerized database and household cards from the SVRS, the address of a selected household was supplied to the enumerator (the local registrar) for identification and data collection. A reserve was made for each PSU for the missed household. The final sample comprised of 420 PSUs³ and 12,600 eligible women over 15 years of age interviewed about current husband, previous husband or non-partner violence. Data collection was carried out from 19th to 28th December 2011.

2.1 Selection of eligible women

One woman member of a selected HH aged 15 years and above became eligible once selected at random by lottery basis. During the interview, eligible women were selected by the enumerator and the supervisor by completing the 'woman selection form'. A household may or may not have had an eligible woman. At each PSU, female interviewer was appointed locally who was working as registrar of SVRS. A supervisor deputed from the local office of BBS at upazila. For quality control and close supervision, every district contains a supervising officer.

2.2 Sample size determination

The minimum required sample size was determined to be about 900 women per stratum i.e. 900 households as only one woman per household (HH) was interviewed due to the sensitive nature of the survey. The sample size calculation was based on the general theory and formula for estimation of proportions:

$$n_{o = deff} \times \frac{(1 - P)Z_{\alpha/2}^2}{Pr^2}$$

Where, p is an a priori proportion of the required characteristics in the population, $Z^2_{\alpha/2}$ value of the standard normal variate allowing 100 α % probability of bad samples, r the allowable relative margin of error, deff design effect used for complex surveys using multi-stage cluster sampling.

As per convention for most socio-economic survey in Bangladesh, α was set as 0.05 and deff set at 1.5. In this particular study, the minimum number of female required in each stratum will be focused and since the number of household in each of the defined strata is fairly larger than 8000, no adjustment for population size was made.

² Female students residing in institutional households e.g. halls, hostels etc. were excluded from enumeration

³ Sub-sample of the 1000 Integrated Multi-Purpose Sample (IMPS) PSUs from BBS' SVRS, which has regularly updated house listings.

The main concern was to choose the p value because a diverse range of variables were under study. According to a recent ICDDR,B study⁴ 61% of women reported ever being physically or sexually abused during their lives, meaning a 39% proportion of not having been physically or sexually abused. Taking this figure (smaller of 39% and 61%) as an a priori for $p = .39$, the sample size is calculated for this study.

With $p = 0.39$, $d_{eff} = 1.5$ and $r = 0.1$, the required minimum sample size become $901 \cong 900$ women. Since the VAW questionnaire will be sensitive in nature, only one woman from one household will be considered for interviewing, hence 900 HH will be required to be drawn from each stratum. By deciding to select 30 HHs from each of the selected EAs at the second stage, the number of EAs required to be selected from each stratum will be 30.

2.3 Allocation of samples to strata

Stratum No.	Division	Locality	No. of PSUs	No. of HH (30 from each PSU)	No .of Women
1	Barisal	Urban	30	900	900
		Rural	30	900	900
2	Chittagong	Urban	30	900	900
		Rural	30	900	900
3	Dhaka	Urban	30	900	900
		Rural	30	900	900
4	Khulna	Urban	30	900	900
		Rural	30	900	900
5	Rajshahi	Urban	30	900	900
		Rural	30	900	900
6	Rangpur	Urban	30	900	900
		Rural	30	900	900
7	Sylhet	Urban	30	900	900
		Rural	30	900	900
	Total		420	12600	12600

It needs to be noted that the sample size suggested will be good enough to find stratum estimates for characterizes which are common (40%-60%). For estimation of rare variables, it should be noted that estimates for smaller delineation like stratum should not be reported. In such cases, the division estimates or national estimates should be used. Moreover the questionnaire recorded the type of HH and also area type and in analysis; those estimates can be obtained using post stratification.

⁴ <https://centre.icddr.org/pub/publication.jsp?classificationID=56&pubID=7197>

2.4 Stratum-wise raising factors for Bangladesh VAW Survey 2011

Name of Division	Estimated number of HH in December 2011	Actual number of samples HH	Actual number of samples HH with at least one woman	Proportion of samples HH with at least one woman	Estimated number of HH with at least one woman	Estimated % distribution of HH with at least one woman	Actual # HH with at least one woman interviewed	Actual % distribution HH interviewed	Weighting factor
	<i>a</i>	<i>b</i>	<i>C</i>	<i>d</i>	<i>e</i>	<i>f</i>	<i>g</i>	<i>h</i>	<i>i</i>
				<i>c/b</i>	<i>a*d</i>	<i>e/e total</i>		<i>g/g total</i>	<i>f/h</i>
Barisal	Rural	900	900	1.000	1,754,379	0.056	895	0.0714	0.7840434
	Urban	900	900	1.000	331,746	0.011	897	0.0716	0.1479289
Chittagong	Rural	900	900	1.000	3,492,279	0.111	900	0.0718	1.5520515

Dhaka	Rural	900	900	1.000	5,540,193	0.177	900	0.0718	2.4621929
	Urban	900	900	1.000	4,572,631	0.146	894	0.0713	2.0458243
Khulna	Rural	900	900	1.000	2,579,351	0.082	894	0.0713	1.1540181
	Urban	900	900	1.000	1,203,616	0.038	898	0.0717	0.5361068
Rajshahi	Rural	900	900	1.000	2,982,684	0.095	899	0.0717	1.3270499
	Urban	900	900	1.000	703,620	0.022	896	0.0715	0.3141014
Rangpur	Rural	900	900	1.000	3,982,187	0.127	897	0.0716	1.7756972
	Urban	900	900	1.000	668,144	0.021	895	0.0714	0.2985979
Sylhet	Rural	900	900	1.000	1,211,664	0.039	890	0.0710	0.5445426
	Urban	900	900	1.000	321,301	0.010	881	0.0703	0.1458733
Total	31,326,464	12,600	12,600		31,326,464		12,530		

Based on sample design

2.5 Questionnaire development

To maintain international comparability, the standard questionnaire recommended by the UN Statistics Division (UNSD) was customized to the country context using the prescribed customization process where all relevant government organizations, UN agencies, civil society and INGO/NGOs working in this area were consulted (e.g. representatives of Ministry of Women and Children Affairs, Ministry of Home Affairs, Ministry of Law, Justice and Parliamentary Affairs, ICDDR'B and local leading NGOs).

The survey tools consisted of two questionnaires, namely the household questionnaire which was comprised of the household and individual modules; and the women's questionnaire which was comprised of the current husband, previous husband and non-partner modules. The questionnaire was pre-tested at field level twice, once in an urban area and another in a rural area with findings incorporated in the final questionnaire.

2.6 Questionnaire pre-testing

The questionnaire was pre-tested at field level two times- one in urban area and another in rural area with a view to verify the following issues:

- Questionnaire structure and formulation of questions
- Time required to fill-in questionnaire
- Respondent understanding of questions asked, and
- Range of variations in different variables.

The findings of the pre-test were evaluated and reasonable questions were incorporated in the final questionnaire according to the UNSD prescribed customization process.

2.7 Composition of the questionnaire

The questionnaire was developed in modular form (Annex C). Main features of the questionnaire are:

Module no	Description of the Module	No. of Questions
	General Instruction	
	Area Identification and Enumerator's Identification	
1.	Household Module	10
2.	Individual Module	10
3.	Selection of Eligible Women Form	
4.	Marital Position of Women	03
5.	Related to Current Husband	26
6.	Related to Previous Husband	26
7.	Other than Husband	27
	Remarks	

2.8 Modern ICR technology in questionnaire design

To save time and avoid redundancy and inaccuracies, the questionnaire was designed in ICR format in bi-color and structured placement format so that the trained enumerator commit minimum distortion. As data have been captured using ICR format, all data and images of questionnaire are electronically available. As a result, responses of such a complex and sensitive issues could be handled without many mistakes. Pre-scanning editing and cleaning for untidiness were easier and inconsistencies were removed in the shortest time to make the report to be published within shortest possible time.

2.9 Selection and training of supervisors and survey team

Female registrars from the BBS's Sample Vital Registration System (SVRS) were engaged as enumerators as they are well trained on data collection and have rapport with the local population. In maximum cases, the Upazila Statistical Officers (USOs) and Junior Statistical Assistants (JSAs) engaged as supervisor in SVRS were also engaged as supervisors in this survey. District coordinators (Regional Statistical Officers, Statistical Officers and Assistant Statistical Officers) received 7 days training in headquarter and in turn trained the enumerators and supervisors for 7 days at district level. The Director General of the BBS (also, Project Director of GIS Maps project) was overall supervisor of the survey.

2.10 Data collection

The enumerators collected data from 19 December to 28 December, 2011 under the close supervision of the supervisors. For household and individual modules, household head or the best knowledgeable member of the household was the respondent and for VAW modules eligible woman was the respondent. After data collection, the completed questionnaires were verified by the supervisors in the field and then submitted to the coordinators on 31st December 2011 for submission to head office at Dhaka.

2.11 Quality control

Considering the sensitivity of the survey one supervisor was engaged with one enumerator for consistent and constant supervision and quality control. They also ensured quality in completing the questionnaire so that data could be captured directly from questionnaire by ICR without any hindrance. The coordinators along with the director were regularly vigilant at each stage of training, data collection and supervision to ensure quality. During the interview of sensitive modules, only women enumerators and respondents were present ensuring privacy to avoid hesitation of the respondents. The district coordinators were active at each stage of training, data collection and supervision to ensure quality. During the interview of sensitive modules, only women enumerators and respondents were present ensuring privacy to avoid hesitation of the respondents.

2.12 Data processing

First, questionnaires were edited manually and then outsourced for data capturing using ICR technology. Raw data were captured in soft form. Despite manual editing, substantial misread information was found in the scanned results which were further checked and corrected through frequency runs and screen editing. A relational database was prepared using Microsoft Access and tabulations prepared using FoxPro and SPSS software.

2.13 Tabulation

Tabulation is the analytical tool for cross classification and summarization of the results systematically in numbers and percentages. Tabulation projects the objectives of the study in numbers and asks for designing the questionnaire in such a way so that the survey and/or census undertaking can produce those results without redundancy. Thus, the questionnaire and the tabulation plan are interdependent.

2.14 Input-output analysis

Before designing the questionnaire it was essential to know the list of items for which data were required to be collected. Thus to design the tabulation plan, an input-output analysis was done where each item of the questionnaire was written in both the rows and columns of an input-output matrix. Then potential intersections were recorded as variables of cross tabulation and individual items were recorded for one way frequency tabulation.

At the second stage tabulation layout of different national and international reports were overlaid on the input-output matrix and comparable list of special tabulations were made and incorporated in the report as analytical and /or text tabulations. The layout of the frequency tables and analytical tables were verified by the technical committee.

2.15 Frequency tables

Frequency tables were first run with live data and inconsistencies between tables, data gaps and impact of non-responses on the tabulations were identified. Classification of variables and formation of group items were made for cross tabulations as well as for text tables. The frequency tabulations are appended as Annex A.

Initially frequency tables were produced at the national as well as stratum level to see the distribution of potential level of analysis. At this stage, level of analysis of both the rarely occurring and frequently occurring variables were identified for further analysis. Un-weighted tabulations with urban-rural break-up were discussed first. Then weighted tables of estimates were produced for the various VAW outcome indicators.

2.16 Analytical tables

Tabulation layout of analytical tables were reviewed and finalized by the technical committee. Tabulation plans recommended by UNSD and different national and international reports were reviewed and incorporated in the analytical tabulation layout of VAW survey of Bangladesh. Tabulations were then made through cross classification of variables and lay out recommended by the technical committee. Tables thus produced are un-weighted. Then weights were appended on individual variable at the micro level and finally weighted tables were produced and presented in the report.

2.17 Response rates

A total of 12600 HHs were to be interviewed. In addition, there was a reserve list of HHs for each EA to replace misplaced HHs (for change or absent in the field). As per the sampling plan, 30 HHs were selected systematically with a random start from each selected EA with replacement. Thus sample size was 12600 households and there were 19,534 eligible women in those households. Of these, 12600 qualified women were selected for interview. In reality, 12,530 women were interviewed. Thus the response rate was 99.44%:

Variables	Number	Rate (%)
Number of qualified women in the sample	19,534	-
Number of women selected for interview (lottery method)	12,600	-
Number of women actually interviewed in the field	12,530	-
Response rate for women’s questionnaire	-	99.44

2.18 Ethics and safety

Safety instructions were imparted to the whole survey team. In addition, the following measures were applied to ensure safety:

- The survey used the safer name of “Survey about Women’s Status” instead of “Violence Against Women Survey,” it was instructed to name in the questionnaire to avoid risk in field operation.
- There was instruction “not to start asking questions until the woman respondent was alone and had given consent”.
- From each household, one respondent was selected so discussion was confidential.
- All the interviewers were women. Only the interviewer & the respondent were present during the interview so that the environment remained confidential and secret for the respondent ensuring privacy and comfort.
- The respondents were assured that their response would be kept confidential.
- The interviewers were given instruction not to disclose any information to others.
- Wording of questions were very straightforward and sensitive words were avoided like dowry, rape or violence in the questionnaire.

Chapter 3

Household and Population Characteristics

In the Violence against Women (VAW) survey, data were collected from a total of 12,600 households and 12,530 women members of age 15 years and above. This chapter provides an overview of socioeconomic characteristics of the population, which includes conditions of the households, availability of electricity, sources of drinking water, sanitation facilities, housing facilities, possession of household durable goods, and ownership of a homestead and land. This chapter also describes the demographic characteristics of the household population, including age, sex, educational attainment, and employment status.

A household in the VAW survey is defined as a person or group of related and unrelated persons who usually live together in the same dwelling unit(s), who have common cooking and eating arrangements. A member of the household is any person who usually lives in the household.

3.1 Household characteristics

Access to basic utilities, sources of drinking water and water treatment practices, access to sanitation facilities, housing structure are physical characteristics of a household that are used to assess the general wellbeing and socioeconomic status of its members. This section provides information from the VAW survey on drinking water, sanitation facilities, housing characteristics, and possession of basic amenities.

Living house

Housing characteristics and household assets can be used to measure the socioeconomic status of household members. Information on the availability of electricity, type of flooring material, sources of drinking water and the distance of sources of drinking water are some important characteristics of household. In this survey 'type of living house' was classified into 6 categories and survey data were tabulated by type of living houses and shown in Table 3.1.

Table 3.1: Percentage distribution of living houses by type of living house

Type of house	Percentage of Total		
	National %	Rural %	Urban %
Straw/Bamboo/Polythene/Plastic/Canvass/Jhupri	9.89	11.12	6.47
Tin (GI Sheet)	48.47	52.03	44.56
Tally/ Semi-Pucca	16.43	13.35	25.12
Pucca	11.34	8.42	19.67
Clay/Mud	13.29	16.62	3.90
Others	1.46	1.80	0.52
Total	100.00	100.00	100.00
No. of households	32302602	23888703	8413899

It is evident from the table that at the national level highest proportion of living houses are made of Tin/GI Sheet (48.47%) followed by Semi-Pucca/Tally (16.43%), Clay (13.29%), Pucca (11.34%), Straw/Bamboo/Polythene (9.89%). In case of rural area proportion of Tin, Bamboo and Mud made houses are larger than those of national averages and conversely in case of urban area the proportion of these types of houses are smaller than those of national averages and tally/semi-Pucca and Pucca are larger than the national as well the rural proportions.

Source of drinking water

Access to safe water and sanitation are basic determinants of better health. Limited access to safe drinking water and sanitation facilities and poor hygiene are associated with skin diseases, acute respiratory infections (ARIs), and diarrheal diseases, the leading preventable diseases in Bangladesh. Sources of drinking water in household were classified into 6 categories. Survey data were then estimated and tabulated by source of drinking water is shown in Table 3.2.

Table 3.2: Percentage Distribution of Households by Source of Drinking Water

Source of Drinking Water	Percentage of Total		
	National	Rural	Urban
Tap	8.16	5.29	16.34
Tubewell/Deep Tube well	89.20	91.58	82.44
Well	1.25	1.61	0.22
Pond	0.88	0.90	0.82
River/Ditch/Canal	0.38	0.48	0.10
Other	0.11	0.12	0.07
Total	100.00	100.00	100.00
No. of households	32302602	23888703	8413899

It is evident from the table that 89.20 % of the households drink water from tube well/deep tube well and 8.16% from tap. Only 1.25% households drink water from well and 0.90% from pond. Rural features are very similar to the national characteristics. In case of urban area 82.44% households drink water from tube well/deep tube well which is followed by tap 16.34%. Drinking water from other sources is negligible.

Distance of source of drinking water

Distance of source of drinking water from the dwelling has been classified into 4 categories. Statistics on 'distance of source of drinking water from the dwelling' is shown in Table 3.3.

Table 3.3: Percentage Distribution of Households by the Distance of Source of Drinking Water

Distance of source from dwelling	Percentage of total		
	National	Rural	Urban
Inside dwelling	47.66	44.13	57.72
Within 200 meters of dwelling	42.89	44.68	37.69
More than 200 meters from dwelling	8.81	10.58	3.82
Not available	0.65	0.62	0.77
Total	100.00	100.00	100.00
No. of households	32302602	23888703	8413899

It is evident from the table that nearly half (47.66%) of cases 'source of drinking water' are located inside the dwelling and in 42.89% cases within 200 meters from the dwelling. In 8.81% cases only 'source of drinking water' are located in more than 200 meters away from the dwelling and in 0.65% cases, there was no response.

In case of rural area the principal source of drinking water is 'located within 200 meters of dwelling' in 44.68% cases, which is followed by 'inside dwelling' (44.13%) and 'more than 200 meters away from dwelling' (10.58%). In case of urban area the principal source of drinking water is located 'inside dwelling' in 57.72% cases which is followed by 'within 200 meters of dwelling' (37.69%) and 'more than 200 meters from dwelling' (3.82%).

Source of light

Households get the light for domestic use from five sources, namely electricity, solar energy, kerosene, biogas and other. Statistics of source of light is shown in Table 3.4.

Table 3.4: Percentage Distribution of Household by Source of Light

Source of Light	Percentage of total		
	National	Rural	Urban
Electricity	61.75	52.77	87.23
Solar Energy	4.16	5.03	1.70
Kerosene	33.31	41.25	10.76
Bio-gas	0.02	0.02	0.02
Other	0.49	0.67	0.01
Non-response	0.26	0.23	0.28
Total	100.00	100.00	100.00
No. of households	32302602	23888703	8413899

The table shows that a principal source of light is electricity 61.75% which is followed by kerosene (33.31%) and solar energy (4.16%). In case of rural area, principal source of light was also electricity (52.77%) which is followed by kerosene (41.25%) and solar energy (5.03%). In case of urban area the principal source of light is also electricity (87.23%) which is followed by kerosene (10.76%) and solar energy (1.70%). Therefore, the urban households are mostly electricity dependent. Rural households are switching towards use of electricity 52.77% from use of kerosene which is 41.25%.

Source of cooking fuel

Indoor pollution has important implications for the health of household members. The type of fuel used for cooking, the place where cooking is done, and the type of stove used are all related to indoor air quality and the degree to which household members are exposed to the risk of respiratory infections and other diseases. Source of cooking fuel in households was classified into seven categories. The survey data were then extrapolated to the national population and tabulated by source of cooking fuel (Table 3.5).

Table 3.5: Percentage Distribution of Households by Source of Cooking Fuel

Source of Cooking Fuel	Percentage of Total		
	National	Rural	Urban
Wood/Bamboo	42.30	38.10	54.22
Kerosene	0.72	0.73	0.69
Gas/LPG	11.05	6.33	24.45
Electricity	0.46	0.29	0.94
Cow-dung	14.54	18.08	4.46
Bio-gas	0.55	0.71	0.08
Others	29.76	35.14	14.49
Non-response	0.63	0.62	0.67
Total	100.00	100.00	100.00
No. of households	32302602	23888703	8413899

It is evident from the table that principal source of cooking fuel is wood/bamboo (42.30%) which is followed by cow-dung (14.54%), Gas/LPG (11.05%). In case of rural area principal source of cooking fuel is wood/bamboo 38.10% which is followed by cow-dung 18.08% and Gas/LPG 6.33%. In case of urban area, the principal source of cooking fuel is wood/bamboo 54.22% which is followed by Gas/LPG 24.45% and cow-dung 4.46%. In all the area 'others' category is also high which might be due to inclusion of straw, leaves etc in this category.

Toilet facility

Households without proper sanitation facilities have a greater risk of diseases like diarrhea, dysentery, and typhoid than households with improved sanitation facilities. In this survey toilet facilities were classified into 4 categories. Survey data classified by category of toilet facility are shown in Table 3.6.

Table 3.6: Percentage Distribution of Household by Toilet Facilities

Toilet Facility	Percentage of total		
	National	Rural	Urban
Sanitary (Water sealed)	32.70	27.15	48.45
Sanitary(Not water sealed)	30.01	29.03	32.77
Non-sanitary/ kutcha	30.99	35.86	17.18
Open space/bush	6.00	7.68	1.23
Non-response	0.29	0.27	0.37
Total	100.00	100.00	100.00
No. of households	32302602	23888703	8413899

It is evident from table that principal source of toilet facility is sanitary-water sealed 32.70% which is followed by non-sanitary/kutcha 30.99% and Sanitary-not water sealed 30.01%, In case of rural area principal toilet facility was Non-sanitary/Kutcha 35.86% which is followed by sanitary-not water sealed (29.03%) and sanitary-water sealed (27.15%). In case of urban area principal toilet

facility is sanitary-water sealed 48.45% followed by sanitary-not water sealed (32.77%) and non-sanitary/kutcha (17.18%).

Distance of toilet facility

Distance of toilet facility from the dwelling has been classified into 3 categories. The survey data are tabulated by distance category and shown at Table 3.7.

Table 3.7: Percentage Distribution of Household by Distance of Toilet Facility

Distance from dwelling	Percentage of total		
	National	Rural	Urban
Inside dwelling	44.01	38.72	59.04
Within 100 meters of dwelling	46.38	49.96	36.20
More than 100 meters of dwelling	7.64	9.10	3.49
Non-response	1.97	2.22	1.27
Total	100.00	100.00	100.00
No. of households	32302602	23888703	8413899

It is evident from the table that the highest 46.38% toilet facilities are available 'within 100 meters of the dwelling' which is followed by 'inside dwelling' (44.01%). Only 7.64% toilets are located in 'More than 100 meters of dwelling'. In case of rural area more toilets are located 'within 100 meters of dwelling' and 'More than 100 meters of dwelling' as compared to national proportion. On the contrary, in urban area more proportion of toilet facilities is located 'Inside dwelling' and less proportion elsewhere as compared to the national proportions.

Ownership of land by any member of household

Survey findings on ownership of land by any member of households and locality are presented in Table 3.8.

Table 3.8: Percentage Distribution of Ownership of Land by any Member of Household and Locality

Type of Ownership of Land	Percentage of Total		
	National	Rural	Urban
<i>(a) Ownership of land by locality</i>			
Possess Land	62.07	64.38	55.50
Do not possess land	37.17	34.85	43.74
Not Stated	0.76	0.77	0.76
Total	100.00	100.00	100.00
No. of households	32302602	23888703	8413899
<i>(b) Ownership of land by gender and locality</i>			
Men	80.87	81.54	78.70
Women	19.13	18.46	21.30
Total	100.00	100.00	100.00

The ownership of land by any member of the household was first classified into two categories- Yes and No. Then yes cases were classified by gender into male and female. The survey shows that at the national level, 62.07% members of households own land. Out of them 80.87 % are male and 19.13% are female. In case of rural area high proportion of males as compared to urban area and conversely, in urban area high proportion of females as compared to rural area own land.

Ownership of house by any member of the household:

Ownership of house by any member of the household is shown at Table 3.9.

Table 3.9: Percentage Distribution of Ownership of House by any Member of Household by Locality

Ownership of House	Percentage of Total		
	National	Rural	Urban
<i>(a) Ownership of house by locality</i>			
Own House	82.20	84.56	75.51
Do not Own House	16.51	14.16	23.19
Not Stated	1.29	1.29	1.30
Total	100.00	100.00	100.00
No. of households	32302602	23888703	8413899
<i>(b) Ownership of house by gender and locality</i>			
Men	85.79	87.1	81.86
Women	14.21	12.9	18.14
Total	100.00	100.00	100.00

The ownership of house by any member of the household was first classified into two categories- Yes and No. Then yes cases were classified into male and female. The survey showed that one/more members owned house in 82.20% households. Out of them 85.79% were male and 14.21% were female. In case of rural area higher proportion of male as compared to urban area own house. In both areas, women ownership is too poor in number although it is a little bit higher in urban area.

Possession of assets

The possession and use of household durable goods have multiple effects and implications. For instance, access to a radio or television exposes household members to updated daily events, information, and educational materials. Similarly, a refrigerator prolongs food storage and keeps food fresh and hygienic. Ownership of transportation allows greater access to services away from the local area and enhances social and economic activities. Possession of assets by locality and type of assets is shown at Table 3.10.

Table 3.10: Percentage Distribution of Possession of assets by household by type of asset and locality

Type of asset	Percentage of Households Possessing Asset		
	Rural	Urban	Total
Boat	3.99	1.37	3.31
Bull/Buffalo cart	3.81	1.85	3.30
Push Cart/ Van	5.26	2.38	4.51
Rickshaw	2.57	2.59	2.57
Bicycle	28.30	20.22	26.0
Motor Cycle	4.33	7.43	5.13
Motor car/Bus/Truck	0.82	1.11	0.90
Scooter/CNG/Auto Rickshaw	1.29	1.37	1.31
Telephone	1.77	4.51	2.48
Mobile	76.92	86.19	79.34
Sewing Machine	8.39	14.65	10.02
Television/Radio	35.67	66.30	43.65
Dish Antenna	16.83	51.65	25.90
Computer	2.53	6.48	3.56
Fridge/Deep fridge	10.07	30.56	15.41
Air Cooler	0.61	0.91	0.69
IPS/Generator	1.37	4.67	2.23
Other Asset	2.76	2.86	2.78
No. of households	32302602	23888703	8413899

Multiple responses

It is evident from the table that highest 79.34% of the households possess mobile at the national level which is followed by television/radio (43.65%), bicycle (26.20%), dish-antenna (26.20%), etc.

In case of urban area possession of television/radio, dish-antenna and fridge/deep fridge, sewing machine, mobile phones are found to be in higher proportion than the rural area. On the contrary, in rural area possession of bicycle, boat, bull/buffalo cart are found to be in higher proportion than the urban area.

3.2 Population characteristics

The age-sex structure of the population is shown by the population pyramid in Figure 1. The pyramid is wider at the base than the top and narrows slightly at the youngest age group. This pattern is typical of a historically high-fertility regime that has recently started to stabilize or decline. Age-sex distribution of survey population is shown at Table 3.11. The table is followed by age-sex population pyramid of Bangladesh for 2011.

Table 3.11: Percentage Distribution of Population by Age and Sex

Age group	Sex status		Total
	Male	Female	
00-04	9.4	9.52	9.48
05-09	11.68	11.15	11.41
10-14	12.57	11.24	11.90
15-19	10.34	9.70	10.02
20-24	8.31	9.14	8.72
25-29	7.59	8.92	8.25
30-34	6.45	7.57	7.01
35-39	6.11	7.24	6.67
40-44	6.22	6.44	6.33
45-49	5.39	5.06	5.22
50-54	4.62	4.22	4.42
55-59	3.33	2.96	3.15
60-64	2.75	2.31	2.53
65-69	1.88	1.64	1.76
70-74	1.49	1.28	1.38
75-79	0.82	0.71	0.76
80 & more	1.01	0.92	0.96
Total	100.00	100.00	100.00
No. of individuals	73601766	73423225	147024991

More than one-third of the household population (33 percent) is under age 15, and nine percent is under age 5. People age 65 and older account for just 5 percent of the total population. The proportion of the population under age 15 is somewhat lower in urban than rural areas, as is the proportion of the population older than age 65.

Figure –3.1: Population pyramid according to VAW Survey

The age-sex distribution of the population indicates that the population of Bangladesh is still young and it is going through demographic transition. It has experienced relatively high fertility in the past recently, narrower base indicates that rapid fertility decline in the country has taken place. The pyramid shows that the cohorts largest in number are those between the ages 05-14. In the adolescent stage more boys exist than girls but immediately after that females are dominating than male up to reproductive age 20-44. The reason may be the out migration for labor force abroad is higher in male than female. Again, in Fifty's the picture is reverse (males are dominating than females). At the end of the service life the out migrants come back to the home. There is a limitation that usually at the last age group, the females dominate in all over the world but it is reverse here. May be this is because of Sample survey. The table also shows that sex ratio is 100.13 & average household size is 4.58 persons. Survey Population has been re-classified into broader age group and shown at Table 3.12.

Table 3.12: Age-Sex Distribution of Population by Economic Group

Age group	Household population	Male	Female
0 - 14	32.79	33.65	31.91
15 - 64	62.34	61.12	63.55
65+	4.87	5.23	4.54
Total	100.00	100.00	100.00
No. of individuals	147024991	73601766	73423225

The table shows that 33% percent of the population is under 15 years and 62% are economically active population and almost 5% are aged 65+.

Relationship with Head of Household

Information on household composition is critical to an understanding of family size and household headship, which can be used to plan meaningful population-based policies and programs. Household composition is also a determinant of general health status and well-being. Percentage of population by relationship with head of the household is shown in Table 3.13.

Table 3.13: Frequency Distribution of Population by Relation with Head of Household

Relation with HH head	Percent	Cumulative Percent
Household Head	21.89	21.89
Husband/Wife	18.86	40.75
Son/Daughter	43.81	84.56
Son in law	6.86	91.42
Brother/Sister	1.47	92.89
Grand Daughter/Son	4.95	97.84
Other relatives	1.37	99.21
No relation	0.44	99.65
Missing	0.35	100.00
Total	100.00	--
No. of individuals	147024990	--

It is evident from the table that 43.81% of the members are children of the head of household (HH), 21.89% are head themselves, 18.86% are their spouse and 15.44% are others.

Marital Status

This section focuses on the key factors other than contraception that affect women's chances of becoming pregnant. These key factors include marriage, polygamy etc. Marriage indicates the onset of exposure to the risk of pregnancy for most women, and thus it is an important fertility indicator. This chapter includes information on several direct measures of the beginning of exposure to pregnancy and level of exposure: for example, age at first marriage, age at first sexual intercourse, and recent sexual activity.

Table 3.14: Percentage Distribution of Population of Age 15 years and above by Age, Marital Status and Sex

Age group	Marital Status					No. of individuals
	Unmarried	Married	Widowed	Divorced	Separated	
	(a) Both sexes					
15-19	84.46	15.01	0.11	0.37	0.06	14738056
20-24	45.76	53.29	0.20	0.42	0.33	12821498
25-29	19.44	79.39	0.43	0.36	0.38	12131787
30-34	6.14	91.53	1.17	0.63	0.53	10304455
35-39	1.47	96.26	1.25	0.62	0.39	9812224
40-44	1.04	94.17	3.59	0.81	0.39	9304368
45-49	0.73	91.86	6.42	0.44	0.55	7681662
50-54	0.46	88.25	10.32	0.53	0.44	6498015
55-59	0.81	83.08	14.72	0.66	0.73	4625257
60-64	0.77	76.79	21.82	0.40	0.22	3717594
65-69	0.63	72.92	25.45	0.73	0.27	2588435
70-74	1.38	66.57	30.44	0.73	0.89	2034684
75-79	1.21	59.14	38.00	0.39	1.25	1124240
80 & more	1.12	51.01	45.94	1.01	0.92	49642716
Total	22.04	71.29	5.75	0.53	0.40	147024991

(b) Males

Age group	Marital Status					No. of individuals
	Unmarried	Married	Widowed	Divorced	Separated	
	(a) Both sexes					
15-19	97.52	2.31	0.04	0.14	0.00	7613072
20-24	71.68	27.87	0.25	0.20	0.00	6114154
25-29	34.73	64.87	0.24	0.13	0.02	5585405
30-34	11.14	88.13	0.37	0.24	0.12	4746568
35-39	2.53	97.06	0.10	0.20	0.11	4499079
40-44	1.74	97.74	0.23	0.07	0.22	4577886
45-49	0.73	98.60	0.63	0.00	0.05	3964558
50-54	0.18	99.19	0.49	0.02	0.11	3399782
55-59	0.61	97.89	1.50	0.00	0.00	2454000
60-64	0.44	96.44	3.11	0.00	0.00	2022245
65-69	0.46	95.63	3.54	0.37	0.00	1381435
70-74	1.27	92.56	5.69	0.00	0.48	1097610
75-79	0.55	87.36	11.06	0.00	1.03	600342
80 & more	0.62	83.78	14.45	0.10	1.05	25545632
Total	29.83	68.95	1.01	0.12	0.10	73601768

(c) Female

Age group	Marital Status					No. of individuals
	Unmarried	Married	Widowed	Divorced	Separated	
	(a) Both sexes					
15-19	70.51	28.58	0.18	0.62	0.12	7124984
20-24	22.13	76.46	0.15	0.62	0.64	6707344
25-29	6.39	91.77	0.59	0.56	0.69	6546382
30-34	1.88	94.44	1.85	0.96	0.88	5557887
35-39	0.58	95.58	2.23	0.99	0.63	5313145
40-44	0.37	90.71	6.84	1.52	0.56	4726482
45-49	0.73	84.69	12.60	0.91	1.08	3717104
50-54	0.76	76.24	21.11	1.09	0.80	3098233
55-59	1.04	66.33	29.65	1.41	1.56	2171257
60-64	1.15	53.34	44.14	0.89	0.49	1695349
65-69	0.83	46.93	50.52	1.14	0.58	1207000
70-74	1.51	36.12	59.43	1.58	1.36	937074
75-79	1.97	26.81	68.86	0.85	1.51	523898
80 & more	1.67	14.85	80.69	2.02	0.78	24097084
Total	14.44	73.57	10.38	0.92	0.69	73423223

Among all the women members of the household whether they are eligible or not, 14.44% are unmarried, 73.57% are married, 10.38% are widowed, 0.92% is divorced and 0.69% is separated. Among the males the corresponding percentages are 29.83%, 68.95%, 1.01%, 0.12% and 0.10%.

Religion: Number and percentage of population by religion are shown at Table 3.15. It is evident from the table that about 88% of the household populations are Muslims, 10% are Hindus, 1.4% are Buddhists and 0.4% are Christians.

Table 3.15: Population by Religion

Religion	Percentage of Total	Cumulative Percentage
Muslim	87.88	87.88
Hindu	10.30	98.18
Buddhist	1.38	99.56
Christian	0.39	99.95
Others	0.05	100.00
No. of individuals	147024990	--

Literacy

Literacy is widely acknowledged as benefiting both the individual and society. Particularly among women, literacy is associated with many positive outcomes, including intergenerational health and nutrition benefits. The ability to read and write empowers both women and men. Knowledge of the level of literacy that a population may attain is important for policymakers and program managers who design information materials. The VAW survey defined literacy based on the respondent's ability to read all or part of a sentence. Literacy status of the household members of age 7 years and above is shown at Table 3.16.

Table 3.16: Status of Reading and Writing

Reading and Writing Status	Rate
Can not read and write	33.40
Can read only	9.76
Can read and write	56.83
No. of individuals	126718530

From the above table, it is observed that 56.83% of the household population can read and write, 9.76% can read only and 33.40% can neither read nor write.

Literacy Level

Highest class passed by population of age 7 years and above is shown at Table 3.17.

Table 3.17: Percentage Distribution of Population aged 7 years and above by Highest Class Passed

Highest Class Passed	Percentage of total
No class passed	28.16
1 class passed	3.51
2 class passed	5.65
3 class passed	5.89
4 class passed	6.22
5 class passed	13.75
6 class passed	4.46
7 class passed	4.54
8 class passed	5.84
9 class passed	7.57
10 class passed	6.88
11 class passed	4.08
12 class passed and above	3.45
Total	100.00
No. of individuals	126718530

It is evident from the table that 28.16% did not pass any class, 35.02% passed 1 to 5 classes, 22.41% passed 6 to 9 classes, 6.88% passed SSC and 7.53% passed HSC and above degree classes.

3.3 Characteristics of women

Marital position of eligible women

From each household one respondent was selected randomly through Lottery. Total number of eligible women is 19,534 & selected 12,600. Out of total eligible women, 15.5% were unmarried, 72.1% currently married, 10.8% widowed & Divorced and separated were below 1%.

	Unmarried	Currently married	Widowed	Divorced	Separated
	15.5	72.1	10.8	0.9	0.8
No. of individuals	69545711	70816430	5747902	520763	394185

Table 3.18: Marital status of selected respondents

Marital Status	Percent of total	Cumulative percent
Unmarried	8.08	8.08
Married	83.31	91.39
Widowed	7.24	98.63
Divorced	0.64	99.27
Separated	0.73	100.00
Total	100.00	--
No. of individuals	32162832	--

Out of the selected respondent, 8.08% were unmarried, 83.31% married, 7.24% were widowed, 0.64% was divorced and 0.73% was separated. A pictorial presentation of the numbers is given in Figure 3.2.

Figure 3.2: Marital status of selected respondents

Current living status of selected respondent:

Current Living and Marital Status of Respondent is shown at Table 3.19 and previously married and current living status of respondent at Table 3.20.

Table 3.19: Percentage Distribution of Living Status of Currently Married Respondent

Living Status	Percent	Cumulative percent
Non-response	2.20	2.20
Married, living with husband	77.70	79.90
Married but not living with husband	5.41	85.31
Unmarried/ married before	14.69	100.00
Total	100.00	--
No. of individuals	32162832	--

From the above table, we see that 77.70% respondent are currently married and currently living with their husband and 5.41 % currently married women do not live with their husband. The remaining 14.69% are unmarried and previously married but currently single.

Table 3.20: Living status of previously married and never married partner

Marital status of previously married and never married respondent	Percentage of total	Cumulative percent
Not applicable	84.42	84.42
Previously married & living with husband	6.98	91.41
Previously married but previously did not live with husband	0.25	91.65
Never married	8.35	100.00
Total	100.00	--
No. of individuals	32162832	--

It is evident from the table that out of the previously married women 6.98% women lived with their previous husband and 0.25% did not live with their previous husband. The remaining 8.35% were never married.

Reason for dissolution of previous marriage

Table 3.21: Percentage distribution of reasons dissolution of previous marriage

Reason for Dissolution of Marriage	Percentage of Total	Cumulative Percent
Not applicable	92.54	92.54
Divorced	0.45	92.99
Due to death of husband	6.66	99.65
Due to 2nd marry of husband	0.16	99.81
Due to difference of opinion	0.06	99.87
Denied to report	0.01	99.88
Due to separation	0.08	99.96
Due to torture of family member	0.02	99.98
Others	0.02	100.00
Total	100.00	--
No. of individuals	32162832	--

It is evident from the table that 92.54 % cases there were no dissolution of marriage. Out of 7.46% cases of dissolution, 6.66% were due to death of husband, 0.45% was due to divorce, 0.06% was due to difference of opinion with husband, 0.02% was due to torture of family member and 0.08% was due to separation.

Reasons for not living with husband

Table 3.22: Reasons for not living with current husband/ previous husband.

Reason	Percent	Cumulative Percent
Not applicable	92.33	92.33
Due to job/education	2.48	94.81
Due to separation	1.25	96.07
Due to illness	0.33	96.39
Others	3.61	100.00
Total	100.00	--
No. of individuals	32162832	--

It is evident from the table that 92.33% respondent lived with their current and previous husbands. Out of the remaining 7.67% cases, 2.48% could not live due to job and education in other areas, 1.25% did not live due to separation, 0.33% due to illness and 3.61% due to other reasons.

Number of times married

Statistics on number of times married by the respondents are shown at Table 3.23

Table 3.23: Number of Times Married by respondent

Number of Times Married	Percentage of total	Cumulative Percent
Non-response	9.80	9.80
1 time	86.30	96.10
2 times	3.69	99.79
3 times	0.16	99.95
4 times	0.08	100.00
Total	100.00	---
No. of individuals	32162832	

It is evident from the table that 86.30% of the respondents married only once. Out of the remaining 13.7%, major percentage of 9.8% were non-response, 3.69% were 2-times married, 0.16% were three times and 0.1% were 4 times. There were no incidents of 5 or more times marriage in the survey.

Order of wife's position: Position of respondent as wife is shown in the following Table 3.24

Table 3.24: Position of wife currently

Position in order of marriage	Percent of total	Cumulative Percent
Non-response	10.48	10.48
1st wife	80.27	90.75
2nd wife	7.87	98.62
3rd wife	1.05	99.67
4th wife	0.32	100.00
No. of individuals	32162832	--

It is seen from the table that 80.27% respondents said that they are the first wife. Only 7.87% said that they are the 2nd wife, 1.05% 3rd wife and 0.32% 4th wife & 10.48% were non-response.

Polygamy

There are predominantly two types of marital unions; monogamous and polygamous. The distinction between the two types has social significance and probable fertility implications, although the association between union type and fertility is complex and not well understood. Polygamy, the practice of having more than one wife, influences the frequency of sexual intercourse and thus may have an effect on fertility. The extent of polygamy was measured in the VAW survey by asking all currently married female respondents whether their husband or partner had other wives (co-wives) and, if so, how many. Currently married women were also asked whether their husband had one or more wives alive currently. Statistics on polygamy is shown in Table 3.25.

Table 3.25: Status of having co-wives currently

Status of polygamy	Percent of total	Cumulative Percent
Non-response	11.2	11.2
More than 1 wife (polygamy)	4.4	15.6
Not more than 1 wife	84.4	100.0
Total	100.0	--
No. of individuals	32162832	--

There are incidents of 4.4% polygamy by husbands in Bangladesh according to the respondent wives. This percentage may increase if non-response cases are verified.

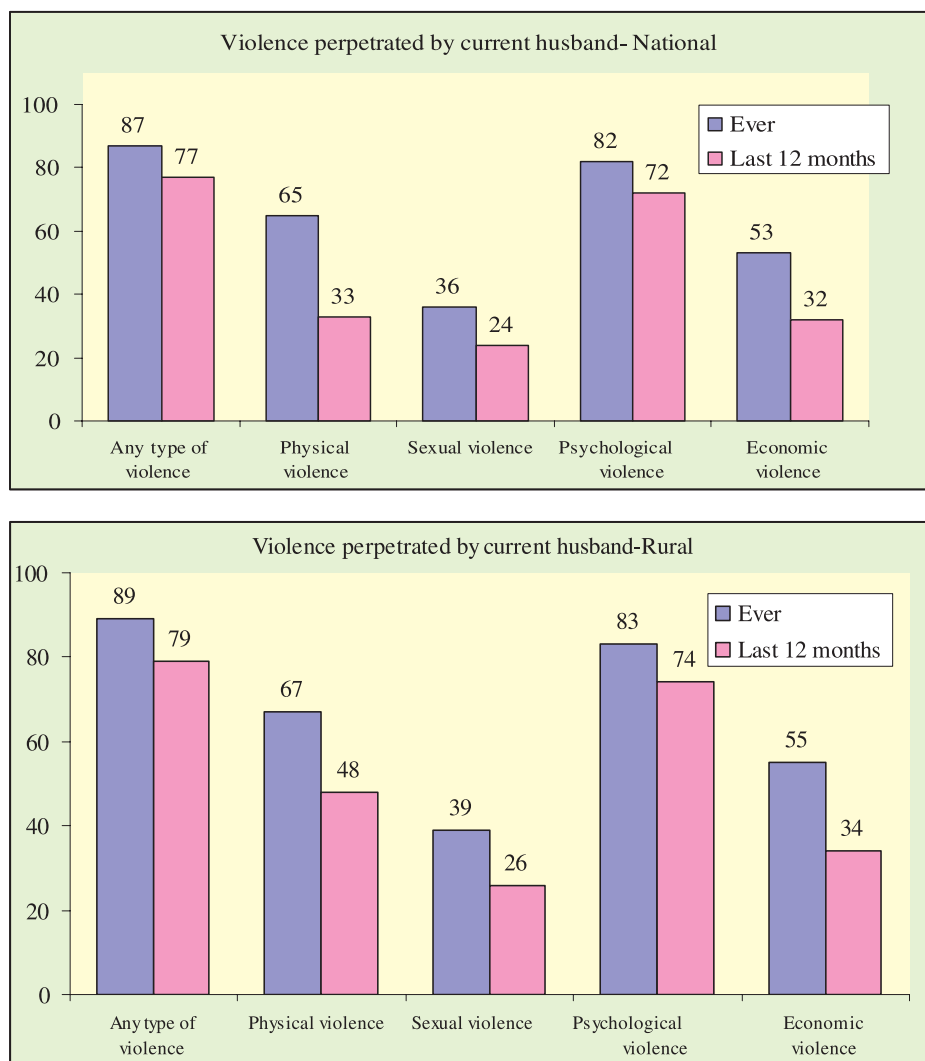

Chapter 4

Violence against Women by Partners

Results regarding the prevalence of violence against married women committed by current husband are presented in Figure 4.1. As many as 87% of currently married women have ever experienced any type of violence by current husband, and 77% reported any type of violence in the past 12 months. Amongst different types of violence reported, psychological violence was most common, followed by physical violence. Prevalence reported in this survey is higher than previously available data⁵.

Figure 4.1: Percentage of women who experienced violence by current husband, by different types of violence

⁵ According to Bangladesh Demographic and Health Survey 2007, the percentage of ever-married women aged 15-49 who have ever experienced physical or sexual violence committed by their husband was 48.7% and 17.8%, respectively.

Table 4.1 presents the prevalence of any type of violence committed against women by type of perpetrator and locality, which points to an alarmingly high rate of spousal violence at home. Almost 90% of those who have ever violated by current husband has the past 12-month experience of violence, which implies the persistent nature of spousal violence. Moreover, the survey results among women ever married more than once indicate that 66% of them experienced violence by current as well as previous husbands while almost all (98%) have ever been violated by either current or previous husbands.

Rural-urban difference is not statistically significant, nor is observed clear trend by age groups in the prevalence of spousal violence (Table 4.2, Table 4.3). Further analysis by education level, employment status, and wealth quintile might be worthwhile.

Table 4.1: Percentage of women who experienced any type of violence, according to type of perpetrator and locality

Perpetrator	National		Rural		Urban	
	Current husband	Previous husband	Current husband	Previous husband	Current husband	Previous husband

4.1 Physical Violence

Table 4.4 presents the prevalence of physical violence committed against women by type of perpetrator, locality, and severity of violence. Sixty-five percent of married women experienced physical violence perpetrated by their current husbands in their lifetime. The recent incidence is also high as nearly half of married women reported such violence in the past 12 months. The data also indicates that prevalence of physical violence seems to be slightly higher in rural than urban areas. As seen in figure 4.2, women aged 20-39 seem to have been most exposed to spousal physical violence in the past 12 months.

Table 4.4: Percentage of women who experienced physical violence, according to type of perpetrator, and locality

Perpetrator	National		Rural		Urban	
	Current husband %	Previous husband %	Current husband %	Previous husband %	Current husband %	Previous husband %

Table 4.7 provides more in-depth analysis on the different acts which physical violence comprises and frequency of such acts reported by those who experienced in the past 12 months. It shows that ‘threatening and shouting with loud voice’ is the most common practice, followed by ‘hurting by slap, fist, and throwing something’ as 57% and 45% of women reported the experience of such behavior of husbands respectively during their married life. The same table also indicates the recurrent nature of such practice as 35% of women reported their husbands threatened or shouted in loud voice more than twice in the past 12 months, including 8% who experienced more than 6 times. Similarly, 17% of women reported their husbands slapped, gave fist, boxed, or threw something more than twice in the past 12 months, which is equivalent to 71% of all the women who experienced husbands’ such behavior in the past 12 months.

Table 4.7: Percentage of women who experienced physical violence by current husband, according to acts

Acts	Occurrence of abuse		Abused in the past 12 months			Abused before 12 months			
	Ever	Past 12m	1 Time	2-5 Time	5+ time	0 time	1 time	2-5 time	5+ Time

Table 4.8 shows rural-urban comparison on the same. For the top two most common violent practices of husbands, prevalence is higher among rural population than urban, though in some cases, more frequency is reported in urban areas. For the rest, the picture is more or less similar between urban and rural.

Table 4.8: Percentage of women who experienced physical violence by current husband, by frequency, according to acts and locality (rural – urban)

Acts	Locality	Occurrence of abuse		Abused in the past 12 months			Abused before 12 months			
		Ever	Past 12m	1 time	2-5 time	5+ Time	0 time	1 time	2-5 time	5+ Time

The survey included several indicators of severity that can be used individually or jointly to assess degrees of severity and the impacts of the women involved. This is to help provide clarity about the nature of these experiences which is essential for differentiating severe from less severe situations, for developing prevention programmes, and for providing appropriate responses and interventions. Impacts and consequences of each different type of assault include the following minimal list:

- Physical injury
- Medical attention needed to treat injuries
- Frequency of acts or episodes of violence
- Violence that occurred during pregnancy
- Fearing for her life or the life of her children or other family members as a result of the violence

Physical injuries as a result of violence acts experienced by surveyed women are summarized in Table 4.9. According to the Friends of the Chair of UN Statistical Commission, “moderate physical violence” by an intimate partner refers to acts that did not result in bruises, cuts, broken bones, need for medical treatment or hospitalization, and where the woman did not fear for her life, and was not pregnant at the time. “Severe physical violence” would include acts that resulted in bruises, cuts, broken bones, need for medical treatment or hospitalization, or situations where the woman feared her life was in danger, or the violence occurred at a time when she was pregnant, in addition to acts of beating, choking, threatening or using a knife, gun or other weapons which are de facto considered acts of severe physical violence regardless of the consequences.

Therefore, all listed below are classified as ‘severe physical violence’ cases. It shows the serious nature of violence faced by significant percentage of women in Bangladesh.

Miscarriage due to violence occurred almost 3% by current husband and 2% by previous husband. In the last 12 months there was no difference in the rate.

Table 4.9: Percentage of women who reported different types of physical injuries as a result of violence

Types of physical injuries	Current husband		Previous husband	
	Ever	Past 12 months	Ever	Past 12 months
Guts, scratches, bruises or aches	23.21	11.02	23.67	6.65

No. of respondents	26792993	26792993	3861464	3861464

Table 4.10 shows the rural-urban comparison on the same, which indicates that generally prevalence of physical violence cases resulting in severe physical injuries are higher in rural areas than urban.

Table 4.10: Percentage of women who reported different types of physical injuries as a result of violence, according to locality (rural-urban)

Types of physical injuries	Locality	Current husband		Previous husband	
		Ever	Past 12 months	Ever	Past 12 months

	Urban	6958356	6958356	1039291	1039291

During the survey, respondents were further asked whether they received the medical treatment for the physical injuries. As seen in Table 4.11, about half of women received medical attention. Personal doctors and government hospitals are most commonly cited providers of medical services in response to physical injuries as a result of domestic violence (Table 4.12).

Denominator: Specified in table 4.9 yes.

Table 4.11: Percentage of women who received medical treatment according to locality

Perpetrators	National	Rural	Urban
Current Husband	51.84	51.69	52.30

Doctors include any type of Doctor . Including Quack, Homeopathy, Ayurvedic etc.

Those who did not seek for medical treatment were asked why, and the findings are summarized in Table 4.13. It indicates about half of the case perpetrated by current husband and 40% of the case perpetrated by previous husband did not require medical attention. In other words, as much as 50% of the physical violence acts perpetrated by current husband and 60% of the physical violence acts perpetrated by previous husband actually resulted in physical injuries requiring medical attention. This confirms the severity of spousal violence in Bangladesh as previously mentioned. The findings further indicate that about one third of women did not seek for medical treatment in fear of their husbands or due to husband's disapproval. Stigma attached to domestic violence should also be noted as almost 9% of women cited 'social prestige' as reason for not having sought for medical treatment.

Table 4.13: Reasons for not seeking medical treatment, according to perpetrator and locality

Reason for No Treatment	National		Rural		Urban	
	Current Husband %	Previous Husband %	Current Husband %	Previous Husband %	Current Husband %	Previous Husband %

Apart from physical injuries, the survey also captures the emotional and psychological effects of physical violence on women. Mental sickness, followed by attempted to suicide, Drug addiction, and abortion are amongst the most commonly cited types of effects (Table 4.14).

Table 4.14: Different type of emotional and psychological effects of physical violence on women, according to perpetrator and locality

Physical and mental impact of physical violence	National		Rural		Urban	
	Current Husband%	Previous Husband%	Current Husband%	Previous Husband%	Current Husband%	Previous Husband%

No. of respondents	7082582	961944	5464489	730992	1618093	230952

Despite the severity of physical violence cases in Bangladesh in terms of degree of physical injuries, mental and physical effects of violence, and frequency of violent acts as seen earlier, only small percentage of women actually took a legal action against physical violence which they experienced (Table 4.15). The fact that more women took a legal action against physical violence perpetrated by previous husband than by current husband may imply the possible linkage between dissolution of the previous marriage and legal action taken against the violence cases committed by previous husband. Court, Police/Thana, Union Parishad, and Village Court are commonly cited places where cases were brought to for legal action (Table 4.16). Union Parishad and Village Court excluded city corporation area but included paurashava (other than city corporation).

Table 4.15: Percentage of women who took legal action against physical violence by perpetrator, according to locality

Perpetrators	National %	Rural %	Urban %
Current Husband	2.36	2.49	1.93
Previous Husband	8.88	9.56	6.84

No. of respondents	426343	211479	344677	170817	81666	40662

The women who did not take any legal actions were asked why, and the findings are summarized in Table 4.17. It indicates that about 40.09% did not think it necessary; about 20% did not take action in fear of potential negative impact on the children’s future; about 16-17% in fear of negative impact on their or families’ social prestige; and about 10% in fear of husband or due to husband’s disapproval. It should also be noted that more than 5% of women mentioned, ‘husband has right to torture wife’ as reason for not having taken legal action against physical violence. These findings depict the culture of shame and silence surrounding domestic violence as the biggest barrier faced by women in accessing justice.

Table 4.17: Reasons for not taking legal actions, according to perpetrator and locality

Reason for no taking legal action	National		Rural		Urban

4.2 Sexual Violence

Table 4.18 presents the prevalence of sexual violence committed against women by type of perpetrator and locality. More than one-third of married women experienced sexual violence perpetrated by their current husbands in their lifetime. The recent incidence is also high as nearly quarter of married women reported such violence in the past 12 months. Age group 20-34 seems to be more vulnerable to spousal sexual violence compared to other age groups (Table 4.19, Table 4.20). For all types of sexual violence, prevalence in rural areas seems higher than urban.

Table 4.18: Percentage of women who experienced sexual violence, according to perpetrator and locality

Table 4.21 provides more in-depth analysis on the different acts which sexual violence comprises and frequency of such acts reported by those who experienced in the past 12 months. It shows that sexual coercion as a result of physical force or in fear of consequence are the most common sexual violence perpetrated by current husband. As many as 26% of women were ever forced to have sex with husband while over 10% of women experienced more than twice in the past 12 months, including 4% who experienced more than 6 times. Similarly as many as 30% of women ever had sex with their husbands because they were afraid of what the husbands might do if they refuse. Over 10% of women experienced more than twice in the past 12 months, including 4% who experienced more than 6 times. In 6% cases the current husband had unusual sex behavior which made their wives feel shameful or disgraceful. These findings show the persistently prevalent nature of sexual violence against women in their marital lives.

Table 4.21: Percentage of women who experienced sexual violence by current husband by frequency, according to acts

Acts	Occurrence of abuse		Abused in the past 12 months			Abused before 12 months

4.3 Psychological Violence

Psychological violence against married women is extremely common and persistently practiced by their husbands in Bangladesh, as over 80% have ever experienced it in their life time with 72% in the past 12 months (see Table 4.23). The prevalence seems slightly higher in rural areas than urban.

Table 4.23: Percentage of women who experienced psychological violence, according to perpetrator and locality

For the sake of analysis of this survey results, acts related to psychological violence are broadly categorized into two: i) psychological tortures; and ii) controlled behavior. Findings on acts comprising psychological violence (i.e., psychological tortures) are reflected in Table 4.26, along with frequency of such acts reported by those who experienced in the past 12 months. Insulting is the

most commonly reported act as 27% of women ever experienced and over 18% experienced more than twice in the past 12 months. This is followed by humiliation in front of others and verbal threatening, both of which were ever experienced by 16% of the women.

Table 4.26: Percentage of women who experienced psychological violence from current husband by frequency, according to acts

Table 4.28 provides in-depth analysis on the different controlled behavior of current and previous husbands. Seven most commonly reported controlled behaviors were as follows:

- 1) Husband becomes angry for wife's talking on face openly – cited by 60% of women.
- 2) Freedom of seeking health care – 46% of the women reported that they need for husbands' permission to seek their own health care.
- 3) Force to maintain parda (Hizab) – About 30% of women reported that their current husbands forced them to maintain parda.
- 4) Misbehavior due to complaints from mother-in-law or sister-in-law – cited by one quarter of women.
- 5) Indifferent treatment or neglect by husbands – cited by one quarter of women.
- 6) Attacking words against parents – cited by 24% of women
- 7) Husband becomes angry if wife speaks with another man – cited by 24% of women

Table 4.28: Percentage of women who experienced controlling behavior by husbands, according to acts

4.4 Economic Violence

About half of ever married women have ever experienced economic violence while one third experienced in the past 12 months (see Table 4.31). The prevalence seems slightly higher in rural areas than urban. Older women seem to be less likely to have experienced such violence.

Table 4.31: Percentage of women who experienced economic violence, according to perpetrator and locality

Table 4.34 provides more in-depth analysis on the different acts which economic violence comprises. It shows that one third of women have paid dowry for the current marriage. Furthermore, almost 30% of the women reported that the current husband refuses to pay pocket money while 17% indicated that their current husband refuses to give enough money for household expenses even when he has money for other things. The higher percentage of such cases was reported against previous husband.

Table 4.34: Percentage of women who experienced economic violence by husbands, by acts

Acts	Current husband		Previous husband	
	Ever	Past 12 Months	Ever	Past 12 months
Refuse to give you enough money for household expenses, even when he has money for other things?	17.00	13.97	26.90	9.23

Are you in marriage with money or property?	33.71	7.33	24.01	5.35
Pressurize you to get money or things from your parents' house?	12.55	7.93	17.68	6.08
No. of respondents	26792993		3861463	

Self earner is 15.23% and freedom of expenditure on earning 11.52% out of 15.23%. Rural-urban comparison is presented in Table 4.35. It shows that occurrence of such events are higher in rural than urban areas.

Table 4.35 Percentage of women who experienced economic violence by acts, according to locality

For Muslims, dower or kabin payable to bride (Denmohor) is pre-requisite or integral part of marriage, while in many cases women are not aware of it. The survey findings on the payment status of dower are shown in Table 4.36. It indicates that on average about 40% of current or previous husbands did not pay dower at all. Non payment is more common in urban areas.

Table 4.36: Payment status of dower, according to locality

Payment status of dower	Current husband			Previous husband		
	National	Rural	Urban	National	Rural	Urban
Paid dower in full	19.77	19.84	19.59	17.62	18.53	15.14

The survey further collected data on husbands' perception about their wives' cash earnings. The findings are presented in Table 4.37, 4.38, 4.39, and 4.40. In 92% cases, husbands are the main earners of the households, while only 2.2% cases wives are the main earners. About 15% of households, women have freedom to work for cash earnings for the household. In such cases, over 90% of husbands feel good about wives' cash earnings. However, average 24% of women do not have control over their own cash earnings. Women's control over their own cash earnings is higher in urban areas, while not much rural-urban difference is observed in terms of other indicators, including women's freedom to work for cash earnings.

Chapter 5

Violence against Women by Non-Partners

Table 5.1 points to the fact that as many as one quarter of women have ever experienced violence perpetrated by non-partner. About one-third of women who have ever violated by non-partner has the past 12-month experience of non-partner violence. This indicates that non-partner violence is not a rare event in Bangladesh. Furthermore, when it comes to the recent incidence of non-partner violence, younger age group (below age 29 years old) seems to be more vulnerable.

Table 5.1: Percentage of women who experienced any type of violence from non-partners, according to locality

5.1 Physical Violence

According to Table 5.3, about 8% of women reported the recent incidence of non-partner physical violence in the past 12 months while almost one quarter of the women reported their lifetime experience of such violence. Table 5.4 shows that younger age group below 29 is more vulnerable to non-partner violence than other age groups, especially in rural areas.

Further analysis of non-partner violence by type of perpetrator (Table 5.5; Table 5.6) indicates that parents, step-parents, and parents-in-law combined represent the most commonly-cited perpetrator of physical violence, followed by other family members, including sisters/brothers-in-law. Also notable is teachers, both male and female, who are reported by 13% of girls aged 15-19 as perpetrators of ever-experienced physical violence. Probably because not many women in Bangladesh are employed, people/colleagues at work place were only mentioned by about 3% of women who have experienced physical violence either in their life time or in the past 12 months

Table 5.3: Percentage of women who experienced non-partner physical violence, according to locality

5.2 Sexual Violence

Table 5.8 presents the prevalence of non-partner sexual violence committed against women by locality. About 4% of women have ever experienced sexual violence by non-partner, and 1% experienced in the past 12 months. Prevalence in rural areas seems higher than urban. Figure 6.2 shows an increasing trend of life-time experience of sexual violence among younger generation, which is worrisome. Table 5.10 confirms such concerns as more than 40% of women on average and 50% of urban women indicated that they had first forced sex at age 14 and below. Three quarter of women indicated that they had first forced sex at age 19 and below.

Table 5.8: Percentage of women who experienced non-partner sexual violence, according to locality

Any type of violence	National	Rural	Urban
Ever	4.37	4.88	3.03
In the past 12 months	1.00	1.03	0.93

5.3 Experience of Abuse in Childhood

Under the non-partner module, the survey collected data on experience of abuse in childhood. According to the findings presented in Table 5.11, 4% of the women responded that they had experienced physical torture during their childhood, while 3% of the women had experienced sexual harassment/teasing. The prevalence is higher among rural than urban women.

Table 5.11: Percentage of women who were abused in childhood, by type of child abuse, according to locality

Type of child abuse	National	Rural	Urban
Physical torture	4.28	2.76	3.86
Mental torture	1.08	0.60	0.94

No of Respondent	23766450	9125433	32891883

5.4 Age at First Marriage

Table 5.12 shows that 56% of ever married women respondents were first married before they reach 18, the legal age of marriage in Bangladesh. Even among younger generation such as age groups 20-24 and 25-29, over 10% of those married women were married below age 15 and about 50% of them were married below age 18. As this table shows only the information about ever married women, the findings are not comparable to those of other surveys such as Bangladesh Demographic Health Survey 2011 which showed a slow but steady increase over the past 25 years in the age at which Bangladeshi women first marry.

Table 5.12: Percentage of women who were first married by age, according to current age group

Age Group	Age at First Marriage						No of Respondent
	<15	15-17	<18	18-19	20-24	25+	
15-19	14.36	54.47	68.83	31.17	0.00	0.00	1113599

5.5 Family members' experience

Lastly under non-partner module, the survey asked questions on family member's experience of the issues related to violence against women: 1) Death or attempted suicide cases of female family members as a result of physical/psychological/sexual violence; 2) Female family members' experience of sexual harassment / teasing in the last 1 year; and 3) Victim of women trafficking as family members.

1) Death or attempted suicide cases

Over 1% each of women respondents mentioned that their female members died or attempted suicide as result of violence. No significant difference between rural and urban respondents was observed.

Table 5.14: Percentage of respondents whose female family members died or attempted Suicide as result of violence in last one year, according to locality

	National	Rural	Urban
Death	1.41	1.39	1.40
Attempted suicide	1.58	1.45	1.54
No of Respondent	32891883	23766450	9125433

Out of those who died, 21% of them were respondents' sisters; 14% were sisters-in-law, and 10% were daughters.

2) Female family members' experience of sexual harassment / teasing in the last 1 year

According to the survey, 1.77 of women respondents mentioned that their female family members had experienced sexual harassment of teasing in the past 1 year. Prevalence seemed to be slightly higher in urban than rural areas. Out of those who had experienced, 28% were respondents' daughters, 20% were the respondents themselves, and 19% were their sisters.

Table 5.15: Percentage of respondents whose female family members experienced sexual Harassment or eve teasing in the last 1 year, according to locality

	National	Rural	Urban
Sexual harassment or teasing	1.77	1.56	2.33
No of Respondent	32891883	23766450	9125433

3) Women trafficking

Table 5.16: Percentage of respondents whose female family members experienced trafficking in the last 1 year, according to locality

	National	Rural	Urban
Women trafficking	0.03	0.03	0.04
No of Respondent	32891883	23766450	9125433

According to the survey, 0.03% of women respondents mentioned that their female family members had become victim of women trafficking.

Chapter 6

Perception of Women about Violence

During the survey, respondents were asked about their opinions as regard to where is the place occurring physical violence (Table 6.1), Sexual violence (Table 6.4) & Psychological violence (Table 6.6) as well as respondents were also asked about their opinions in which marital situation usually the violence takes place (Table 6.2, 6.3, 6.5) etc.

Perception about physical violence:

Husband's house is the most commonly cited site for physical violence, as 88% of the women perceived about it. This is followed by parents' house (21%), work place (16%), and transport/road (14%), education institution (13%) and solitary place/public place/traveling site (13%).

Table 6.1: Perception about place where physical violence takes place by site, according to Locality

Place of Occurrence(Physical Violence)	Percentage		
	Rural	Urban	Total
Parents' house	23.05	15.78	21.03
Working place	16.14	16.32	16.19
Solitary place/Public place/Traveling site	13.83	10.06	12.78
Coaching Centre	4.50	5.79	4.86
Station Bus, Launch and train	6.64	8.46	7.15
Husband's house	88.37	85.83	87.67
Market	5.98	3.63	5.33
Educational Institution	13.03	14.44	13.42
Hospital/Nursing home/Health centre	6.17	4.95	5.83
Transport/Road	13.80	15.29	14.22
Other	0.60	0.77	0.65
No of Respondent	23766450	9125433	32891883

Respondents were also asked about their opinions as regard to the marital status and vulnerability to physical violence. According to Table 6.2, 78% of women said that married women are likely to become victim of physical violence while about just over 20% of women pointed out the vulnerability of unmarried, separated and divorced women to physical violence.

Table 6.2: Perception about marital status and vulnerability to physical violence by locality

Marital Status of likely victim	Percent		
	Rural	Urban	Total
Unmarried	22.95	20.59	22.30
Married	79.18	76.28	78.38
Separated	21.93	19.59	21.28
Divorced	22.73	21.97	22.52
Others	3.37	3.26	3.34
No of Respondent	23766450	9125433	32891883

Perception about sexual violence:

Just like physical violence, respondents were asked about their opinions as regard to the marital status and vulnerability to sexual violence (Table 6.3). This shows very different picture from that of physical violence where married women are most commonly cited as likely victim. In case of sexual violence, unmarried women are perceived as the top victim, cited by 54% of rural women and 62% of urban women.

In terms of opinions as regard to where is the place occurring sexual violence (Table 6.4), husband's house still marks the top most commonly cited site, but the percentage of women who mentioned about it (54%) is much lower than physical violence case (88%). Instead, the percentage of women cited solitary place/public place/traveling site as place occurring sexual violence (44%) is much higher compared to physical violence case (13%).

Table 6.3: Perception about marital status and vulnerability to Sexual violence, according to Locality

Marital Status of likely victim	Percent		
	Rural	Urban	Total
Unmarried	53.98	61.57	56.08
Married	50.14	38.89	47.02
Separated	30.41	25.09	28.93
Divorced	30.18	28.72	29.77
Others	2.03	1.35	1.84
No of Respondent	23766450	9125433	32891883

Table 6.4: Perception about place where sexual violence takes place by site, according to Locality

Place of Occurrence (Sexual Violence)	Percentage		
	Rural	Urban	National
Parent's house	17.61	10.17	15.55
Working place	27.70	32.09	28.92
Solitary place/Public place/Traveling site	42.88	45.03	43.48
Coaching Centre	10.11	10.71	10.28
Station Bus, Launch and train	10.12	9.47	9.94
Husband's house	56.01	50.26	54.41
Market	9.45	6.40	8.60
Educational Institution	11.08	15.99	12.44
Hospital/Nursing home/Health centre	12.21	11.78	12.09
Transport/Road	16.56	16.00	16.40
Other	1.24	1.44	1.30
No of Respondent	23766450	9125433	32891883

Perception about Psychological violence:

Table 6.5 shows the respondents' opinions as regard to the marital status and vulnerability to sexual violence. Similar trend is observed as the case of physical violence, with married women being most cited as likely victim.

Table 6.5: Perception about marital status and vulnerability to Psychological violence, according to locality

Marital Status of likely victim	Percent		
	Rural	Urban	Total
Unmarried	26.76	23.15	25.76
Married	68.12	68.96	68.35
Separated	35.08	34.06	34.80
Divorced	37.71	34.42	36.79
Others	1.46	0.66	1.24
No of Respondent	23766450	9125433	32891883

Table 6.6 shows the respondents' opinions as regard to the place where sexual violence takes place. Just like the case of physical violence, husband's house is the most commonly cited place, as 86% of the women mentioned about it. This is followed by working place (26%), parents' house (23%), education institution (12%) and transport/road (11%).

Table 6.6: Perception about place where Psychological violence takes place by site, according to locality

Place of Occurrence (Psychological Violence)	Percentage		
	Rural	Urban	National
Parent's house	23.60	19.99	22.60
Working place	25.65	24.98	25.46

Chapter 7

Conclusion and Recommendations

This is the first nationally representative survey on violence against women (VAW) that is perpetrated by the current husband, previous husband and non-partner perpetrators. Survey data also compiled household characteristics including household assets, personal characteristics, psychological violence, economic violence, physical violence, sexual violence, impact of violence, treatment for effect of violence, lack of treatment, site of sexual and physical violence, time of violence, and relationship with the perpetrators of sexual and physical violence, age and marital status of victims, etc. Thus the results can be used as a comprehensive and benchmark database on VAW in Bangladesh. The knowledge obtained by this survey is the strongest evidence of the immense physical, sexual, psychological and economic violence that Bangladeshi women endure every day. The statistics on gender based violence now speak in clear language of the effects and impact on society, demanding immediate action to eliminate all kinds of violence against women and create a society free from discrimination and inequalities. The reality of VAW should be disseminated at large scale.

The perpetuation of violence against women has root in old patriarchal beliefs and behavior systems which are upheld and nurtured by a culture of silence. Breaking the negative circle of silence is a precondition for change, and it necessitates strong involvement of men and youth. Violence against women and girls is not inevitable. The survey results emphasize that we all need to do better to protect women and prevent this pervasive human rights violation. New and improved laws and their implementation are crucial to end impunity for violence against women and girls. Action plans for safe houses, free hot line services and free health and legal aid to survivors are also important areas. The education system should teach human rights, equality and mutual respect and the youth should be in front to end violence against women and girls. There is a need for more women in politics, law enforcement and peacekeeping forces, equal economic opportunities and decent jobs for women. These are to protect the rights of women and girls, and to ensure that national laws and services meet international standards.

Bangladesh has signed many international treaties and conventions, and has enacted different national laws and policies in favor of establishing women's rights. However, Bangladesh's personal laws governing marriage, separation and divorce explicitly discriminate against women. These laws give men greater powers than women in marriage and accessing divorce. The GOB introduced the Domestic Violence Act in 2010 with the aim to ensure women's rights. While this is welcomed, it would be required to introduce the law and create awareness on a nationwide scale to the people at large. Furthermore, to take effect, the law should in particular be known and understood by service providers such as the police, lawyers and judges, social workers, health personnel. In the same line, a comprehensive policy response to the Dowry Prohibition Act should be ensured. It would include implementation of the Act and address the under-lying socio-economic reasons. The specific recommendations and lessons learned are summaries below:

1. Recommendations on operational issues

- 1.1 This report should be disseminated through seminars, symposiums and workshops at the national and district level before researchers, policy makers, social workers, medical practitioners, law enforcing agencies, NGOs, public representatives and so on.

- 1.2 Follow-up survey needs to be conducted after two years or reasonable time to cover new areas and new societies and the results be made available to the Ministry of Women and Children Affairs for enactment of laws and formulation of policies, adoption of protective measures and initiation of social movement for cohesion and enforcement of women empowerment, equality and equity in all spheres of life and activities.
- 1.3 The scope of the survey is required to be expanded in consultation with the users, experts, policy makers, planners, researchers and NGOs with special care for women empowerment in decision making, legislation and equity in employment, ownership, wage rate, and monitoring of receipt of justice, treatment, equal rights, etc.
- 1.4 Lessons learnt from each phase of survey may be documented and be reflected in the next phase of the survey for improvement and should be evaluated and corrective measures needs to be taken by the Ministry of Women and Children Affairs for ensuring equal rights and privileges for women in all spheres of life. Implementation of Strong Law and order can discourage the people who make violence to women.
- 1.5 A high level committee may be formed to ensure removal of violence against women and establishment of equal rights and empowerment of women like men in the society. Monitoring cell may be established in the Ministry of Women and Children Affairs to monitor implementation of laws and policies for equal rights for women in every social, economic and decision making activities.
- 1.6 Improved coordination between other government ministries and organizations required. Team has to be designated to conduct this survey on regular interval and exposure on the issue and global development should be available for the team.
- 1.7 BBS should increase the capacity of printing ICR questionnaire in-house. BBS needs to develop its own ICR data capturing system.
- 1.8 Enumerators should receive training on counseling so they can assist victims morally.
- 1.9 Collaboration between user's needs to be improved and their requirements need to be identified specifically before the next survey.

2. Programmatic recommendations

- 2.1 Existing family courts should have power to issue interim orders to grant interim maintenance until final orders are passed. The capacity of family courts should be strengthened to handle separation, divorce, maintenance, and 'Denmohor' cases expeditiously and fairly. Backlogs and delays should be reduced, including by appointing more family court judges or decreasing judges' case load, and reforming summons and decree execution procedures.
- 2.2 Initiate a nationwide awareness about the negative consequences of polygamy, including its linkage with domestic violence. Work should be aimed at abolishing it. Information should be available in various media and in formats accessible to those with disabilities.
- 2.3 Broader dissemination of information on social assistance programs should be undertaken; information should be available in a variety of media and in formats accessible to people with disabilities to improve women's awareness of existing programs, eligibility criteria, and application procedures. Existing social assistance programs should be linked to family courts.
- 2.4 Implement legal and criminal justice systems to prevent further violence, facilitate recovery and ensure access to justice (specialized police units, restraining orders and multi-agency sectoral response teams).

- 2.5 It is crucial that the government increase efforts to raise the status of women, both in terms of awareness of their rights, and through concrete measures in fields such as employment, education, political participation and legal rights. This will boost the achievement of MDG 3.
- 2.6 In the area of sexual violence in the home, the BBS survey has particularly stated that the age group 22-34 seems to be more vulnerable to spousal sexual violence compared to other age groups, and for this reason the preventive and protective services could be strengthened.
- 2.7 Processes and procedures should be reviewed and changed to ensure quality and standard protocols and to obtain justice without discrimination in areas of stalking and rape cases. This includes post-rape care and free legal aid so that women will understand their rights and options.
- 2.8 Resource allocation to combat violence against women should be revisited and adequate ceilings ensured. Moreover, information, awareness and education on GBV are urgently required.
- 2.9 Cases of VAW are underreported, and existing data should be analyzed and disseminated on a regular basis at various levels. Such information would provide policy makers with reliable data on the prevalence of VAW for informed decisions to combat VAW.
- 2.10 Access to quality education. The findings that teachers, both male and female, are reported by 13% of girls aged 15-19 as perpetrators of ever – experienced physical violence, stresses the importance of a continued focus on all aspects of the secondary education system including the quality of teachers.
- 2.11 Gender equality and ending violence against women must be placed squarely at the heart of achieving the Millennium Development Goals by 2015.
- 2.12 Non-violent social norms should be promoted by sending strong messages that violence against women and girls will not be tolerated. The media should be continuously engaged in shaping public opinion and challenging the harmful gender norms that perpetuate
- 2.13 Interventions should change harmful social and cultural norms and facilitate the development of new notions of masculinity associated with non-violence, respect and equality. They should target the change of adolescent boys and men's attitudes that ignore gender inequality and violence.

ANNEXURE

Age-specific violence for ever by residence:

Position of Women Survey-2011

Questions in this module are four grouped as follows

- R - Relationship information from respondent
- V - Husband / Partner Violence
- N - Non-partner Violence
- Z - Completion of interview

Eligible Women Selection Form

Hello, My name is..... I am here on behalf of Bangladesh Bureau of statistics. We are conducting a survey to know the situation of women in the family and in the society. On behalf of the survey, I will ask you some questions. Please respond rightly.

1. Can you tell me Please how many people live in the Household , and share food? PROBE: Dose this include children (including infant) living here? Does it include any other people who may not be members of your family, such as domestic servants, lodgers or friends? (Make Sure Whether These People Are Included In The Total)					Total no. of people in Household <div style="border: 1px solid black; width: 40px; height: 20px; margin: 5px auto;"></div>
2. Is the head of the household male or female?					Male-----1 Female-----2 Both -----3
	Female Houshold Members	Relationship to Head of HH	Relationship	Age	Eligible Women
3. Line Number	(For some of the questions) we would like to talk to one woman from your household. To enable me to identify whom I should talk to, would you please give me the nick names of all girls or women who usually live in your household (and share food).	What is the relationship of name to the head of the household. *use codes below	Do they Name usually live here? Special cases: see (A) below. Yes No	What age? (B)	See Criteria Below (A+B) Yes No
1			1 2		1 2
2			1 2		1 2
3			1 2		1 2
4			1 2		1 2
5			1 2		1 2
6			1 2		1 2
7			1 2		1 2
8			1 2		1 2
9			1 2		1 2
10			1 2		1 2

CODES

01	Head of the H/H	06	Mother	11	Adopted	98	Other non relative
02	Wife	07	Mother-in-law	12	Step Daughter		
03	Daughter	08	Sister	13	Domestic Helper		
04	Daughter-in-law	09	Sister-in-law	14	Lodger		
05	Grand Daughter	10	Other relative	15	Friend		

(A) Special Cases to be considered member of household:

- Domestic servants if they live in 6 months or more in the household.
- Visitors if they have slept in the household for the past 6 months or more.

(B) ELEGIBLE: Any women 15 years and older living in this household.

MORE THAN ONE ELIGIBLE WOMEN IN HH :-

- Select randomly one eligible woman for interview. To do this, write the line numbers of eligible women on pieces of paper, and put in a bag or box. Ask a household member to pick up a number-In this way selected woman will be interviewed.
- Put Cross on Line Number of selected Woman. Talk with her if she is available, if she is not at home, fix date for return visit.
- Continue with household questionnaire.

No Eligible woman in HH :-

- Say “I can not continue because I can only interview women 15 and over. Thank you for your assistance”.
- Finish here.

*if both (male and female) are the head, refer to the male.

Violence Against Women Module

Check HH selection form	Woman Selected for this Module { } ↓		
Informed consent and privacy	<p>(READ TO RESPONDENT)</p> <p>Now I would like to ask you questions about some other important aspects of a woman's life. Some of the topics may be difficult to discuss, but many woman have found it useful to have the opportunity to talk. You do not have to answer any questions that you do not want to. I want to assure you that all of your answers will be kept strictly secret and will not be told to anyone. And no one else will know that you were asked these questions.</p> <p>Do you have any questioner? Do you agree to be interviewed?</p>		
R01	Are you at the moment married and living with husband? (Correct answer will be crossed)	Married, at the moment living with husband ----- 1 Married, at the moment not living with husband -- 2 Not married / previously married ----- 3	⇒ R04 ⇒ R03A
